# General Methodologies

## Overview and basic assumptions

### Index Administration

This report provides details of the methodologies used to compile the ICE BofAML Bond Indices (the report provides details of the methodologies used to compile the defined by IOSCO report provides details of the methods) by ICE Data Indices, LLC (IDI) and are constructed based on a defined set of rules which spell out all pertinent details of how an Index is compiled. The rules for compiling an Index are established when the Index is first created and specify the criteria for selecting constituent securities. The rules also establish the methodologies for weighting, valuing and rebalancing the constituents. Detailed rule documents are publicly available on our systems.<sup>1</sup>

### Annual rules review

Potential rule changes are considered on an annual basis. An initial set of proposed changes under consideration is published in April. Investor clients are encouraged to comment on the proposals by way of an online survey. At the end of a three-month commentary period, final decisions are announced in July and adopted changes, if any, are generally implemented at the September month end rebalancing.

Custom Indices that are based off standard Indices affected by these rule changes automatically pick up the new rules of the standard Indices from which they are derived unless the sponsor of the Index notifies us in advance of their desire to modify the rules for their custom Index.

IDI, at its sole discretion, reserves the right to issue rule changes apart from this annual cycle in the event that such a change is deemed necessary in order to deal with extraordinary circumstances including, but not limited to, changes in data availability.

### Limitations

All of the ICE BofAML Bond Indices produced by IDI may be subject to potential limitations in terms of the number of qualifying constituents and diversification. In some cases this is by design. For example, the ICE BofAML Current 2-Year US Treasury Index will always have a single constituent security. In other cases, there can be a decline in the pool of qualifying constituents due to changes in issuance trends and other factors that can affect the underlying market measured by the index. In addition, some indices are designed to measure smaller subdivisions of larger indexes. As an example, many of our indices have a standard set of sub-indices that segment the larger index by maturity and/or rating as well as other factors. In some cases, one or more of the sub-indices may be thinly populated, but by publishing the entire set we allow for a complete representation of the broader index across key factors.

It may occur that a particular sub-index may not have any qualifying constituents for a period of time. During any period in which there are no qualifying constituents for a given index we suspend its publication. Publication of that index is resumed when it once again is populated with at least one qualifying security; however, its index value is reset to 100 at the point of resumption.

Other limitations may include the ability of the Benchmark to operate in illiquid or fragmented markets.

IDI seeks to manage and mitigate these limitations through the Benchmark design, review and oversight process.

### Expert Judgment

“Expert Judgment” refers to the exercise of discretion by an Administrator or Submitter with respect to the use of data in determining a Benchmark. Expert Judgment includes extrapolating values from prior or related transactions, adjusting values for factors that might influence the quality of data such as market

---

<sup>1</sup> Website: [indices.theice.com](https://indices.theice.com)

events or impairment of a buyer or seller's credit quality, or weighting firm bids or offers greater than a particular concluded transaction.

While IDI mostly relies on input data obtained from its sources, on certain occasions, where decisions relating to the pricing of a Benchmark are required to maintain the integrity of the values and ensure that the Benchmark continues to operate in line with the methodology, IDI may apply Expert Judgment. Where it is required in a Benchmark determination, it may only be applied by suitably experienced and qualified staff Members on the IDI team. Using their expertise and knowledge, and the information available to them, they will make an assessment of what input data or security evaluation would be most appropriate to use to correctly reflect the Benchmark objective.

Ultimately any exercise of Expert Judgment is overseen by the Governance Committee of IDI, which ensures that the published Methodologies have been followed.

## **Exceptional market conditions and corrections**

IDI retains the right to delay the publication of the index level. Furthermore, IDI retains the right to suspend the publication of the level of the index if it believes that circumstances prevent the proper calculation of the index.

If evaluated prices are not available, the index will not be recalculated unless IDI decides otherwise.

Reasonable efforts are made to ensure the correctness and validity of data used in index calculations. Where errors have occurred in the determination or calculation of an index, the decision to make a restatement will be assessed on a case by case basis. Such decision will take account of the significance; impact; age; and scale of the error.

In the event that there is a market-wide event resulting in evaluated prices not being available, IDI will determine its approach on a case by case basis, taking into account information and notifications provided by Interactive Data. Market-wide events include, but are not limited to, the following:

- Technological Problems / Failures
- Natural Disaster or Other BCP-Related Event

IDI will communicate any issues with publication of the indices during the day through the regular client communication channels; in addition, IDI may also contact clients directly; post a notice on the IDI website; send a message via the market data portal, or use other such forms of communication.

## **Rebalancing**

Unless otherwise specified, the Indices are rebalanced on the last calendar day of the month, based on information available up to and including the third business day before the last business day of the month (the "lock-out date"). No changes are made to constituent holdings other than on month end rebalancing dates.

## **Accrued interest and cash**

With the exception of US securitized products (MBS, CMBS, CMO and ABS), accrued interest is calculated assuming next-day settlement. Accrued interest for US securitized products assumes same-day settlement. Cash flows from bond payments that are received during the month are retained in the Index until the end of the month and then are removed as part of the rebalancing. Cash does not earn any reinvestment income while it is held in the Index.

## **Default definition**

Securities are considered in default based on their individual legal terms. In accordance with this, securities covered by a valid stand-still or forbearance agreement are not viewed in default, nor are instances where a court-appointed administration status prevents acceleration. A rating of "D" by a major rating agency is not a consideration for default status.

## **No re-entry once removed for lack of pricing**

If a bond that is a constituent of one or more of the Indices is removed due to lack of pricing that bond will not qualify for entry into any Index at a later date even if adequate pricing subsequently becomes available.

## **At least 18 months to final maturity at issuance to qualify**

With the exception of government bills (other than Brazil bills) and US ABS and CMBS, a security must have at least 18 months to final maturity at the time of issuance in order to qualify for inclusion in the Indices.

# **Special treatment for particular security types**

## **144a for life**

Unless otherwise specified, 144a-for-life securities qualify for inclusion in the Indices. In cases where both a 144a and RegS identifier are issued, the 144a identifier is used for USD-denominated bonds and the RegS identifier is used for all other currencies.

## **Perpetual securities**

The first call date is used as the assumed final maturity for perpetual bonds when determining qualification with respect to maturity criteria of a given Index. For example, a perpetual bond with a call date in less than five years is included in the 1-5 year Index and excluded from the 5+ year Index; whereas a regular callable bond with a fixed final maturity in 30 years that is callable within 5 years is excluded from the 1-5 year Index and included in the 10+ year Index.

## **Fixed-to-floating rate securities**

Fixed-to-floating rate securities qualify for inclusion in the fixed-rate Indices provided the security is callable within the fixed rate period. The last date on the call schedule that falls within the fixed rate period is used as the assumed final maturity for purposes of determining inclusion in maturity sub-Indices. Securities that are not called on or before the coupon transition date qualify for the floating-rate Indices.

## **Fixed-to-variable rate securities**

Fixed-to-variable rate securities (eg, such as a security that resets to a spread off a current 5 year swap rate) provided they are callable within the initial fixed rate period. The first call date is used as the assumed final maturity for purposes of determining inclusion in maturity sub-Indices.

## **Contingent capital securities (cocos)**

Contingent capital securities (cocos) qualify only for the stand-alone Contingent Capital Securities Index (ticker COCO), its sub-Indices and any blended Index that includes a Contingent Capital Index/sub-Index as a component. For purposes of Index qualification we define a contingent capital security as a security having a conversion feature with a mechanical trigger at a specified capital level that typically transforms the debt into common equity or writes it down. Other capital securities, where conversion can be mandated by a regulatory authority but which have no specified trigger, are not treated as contingent capital securities and qualify for inclusion in the corporate Indices.

## **Securitized corporate securities**

Securitized corporate securities, such as pass-through trust certificates, EETCs and similar hybrid securitized debt, do not qualify for inclusion in any investment grade or high yield corporate Index.

## Securities issued by Intercontinental Exchange

Securities issued by Intercontinental Exchange (ticker ICE) are not included in the indices because they are not evaluated by our price provider, ICE Data Pricing & Reference Data, LLC.

## Treatment of security events

### All bond, securitized and preferred indices

Type	ICE BofAML Treatment
Full call	The security is removed at the next month-end rebalancing following the call announcement, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). If announced after this date, then the security is removed at the following month-end rebalancing. The constituent price at point of removal is based on the call price. It is the call price if removed after the call effective date or the present value of the call price if before.
Partial call	The amount of the partial call is reduced from the constituent's amount outstanding at the next month-end rebalancing following the call announcement, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is reduced at the following month-end rebalancing.
Tender	The amount of the tender is reduced from the security's amount outstanding at the next month-end rebalancing following the results announcement, provided that announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is reduced at the following month-end rebalancing.
Repurchase/Increase	The amount repurchased and retired is reduced from the security's amount outstanding at the next month-end rebalancing following the call announcement, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is reduced at the following month-end rebalancing. Likewise, any increase in amount outstanding due to add-on or tap issuance is added to the security's amount outstanding at the next month-end rebalancing following the issue date, provided the issue date is on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is added at the following month-end rebalancing.
Exchange	The legacy security is held in the index until the next month-end rebalancing after the exchange announcement, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the legacy security is held in the index until the following month-end rebalancing. The price of the legacy security between the effective date of the exchange and the month-end rebalancing date when it is removed reflects the value of the new securities if they are index eligible, or the cash value of the exchanged securities at point of exchange if they are not.
Identifier/name change	The identifier/name is updated at the next month-end rebalancing following the effective date of the identifier/name change, provided the

Type	ICE BofAML Treatment
	announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the identifier/name change is made at the following month-end rebalancing.
Payment in kind	Any additional securities paid as interest or dividend are assumed received and sold at the index price (based on next-day settlement assumption) and held as cash until the next month-end rebalancing.
Sinking fund payments	The amount of any sinking fund payments is reduced from the security's amount outstanding at the next month-end rebalancing following the scheduled sink date,
Prepayment of principal	For securitized products, the face amount retired due to any prepayment of principal is reduced from the security's amount outstanding at the next month-end rebalancing following the results announcement, provided that announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is reduced at the following month-end rebalancing. The performance impact of prepayments are reflected in the index the day the information is received.
Maturity	Securities reaching maturity while an index constituent remain in the index until the next month-end rebalancing. The security's price between the maturity date and the next rebalancing is the redemption price.
Listing or delisting from primary exchange	For indices with listing criteria, the listing status of a security or its underlying equity is updated at the next month-end rebalancing following the effective date of the change, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the listing status change is made at the following month-end rebalancing.
Default	Securities in legal default are removed at the next month-end rebalancing following the default event, provided the event occurs on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the security is removed at the following month-end rebalancing. The security is removed from the index at the market price on the date of removal.

## Convertible indices

Type	ICE BofAML Treatment
Full call	The convertible security's amount outstanding is reduced following a one-day notification period. The cash value of the called face amount is based on the call price. The cash is reinvested at the next month-end rebalancing.
Partial call	The convertible security's amount outstanding is reduced following a one-day notification period. The cash value of the called face amount is based on the call price. The cash is reinvested at the next month-end rebalancing.
Tender	The convertible security's amount outstanding is reduced after the announced results are publicly available following a one-day notification period. The cash value of the tendered face amount is based on the tender price. The cash is reinvested at the next month-end rebalancing.
Repurchase/Increase	The amount repurchased and retired is reduced from the security's

Type	ICE BofAML Treatment
	amount outstanding with one-day notice following the announcement. Any increase in amount outstanding due to add-on or tap issuance is added to the security's amount outstanding at the next month-end rebalancing following the issue date, provided the issue date is on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the amount is added at the following month-end rebalancing.
Exchange	The legacy security is held in the index until the next month-end rebalancing after the exchange announcement, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the legacy security is held in the index until the following month-end rebalancing. The price of the legacy security between the effective date of the exchange and the month-end rebalancing date when it is removed reflects the value of the new securities if they are index eligible, or the cash value of the exchanged securities at point of exchange if they are not.
Identifier/name change	The identifier/name is updated at the next month-end rebalancing following the effective date of the identifier/name change, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the identifier/name change is made at the following month-end rebalancing.
Special payments and interest/dividends in shares	Any special payments are held as cash and reinvested at the next month-end rebalancing. Equity shares received as interest, dividend or special payment are converted into cash at the ex-date and reinvested at the next month-end rebalancing.
Mergers, acquisitions and other corporate events	Corporate events affecting a convertible security's underlying equity or basket are updated on the effective date of the event.
Voluntary conversion	The convertible security's amount outstanding is reduced following a one-day notification period. The cash value of the converted shares is based on the closing equity price on the day of the amount outstanding reduction. The cash is held in the index and reinvested at the next month-end rebalancing.
Mandatory conversion of constituent at maturity	For convertible securities with mandatory conversions at maturity the security is removed from the index at the month-end rebalancing date before its final conversion/maturity date. The security is removed at the market price on the date of removal.
Maturity	Securities reaching maturity while an index constituent remain in the index until the next month-end rebalancing. The security's price between the maturity date and the next rebalancing is the redemption price.
Listing or delisting from primary exchange	For indices with listing criteria, the listing status of a security or its underlying equity is updated at the next month-end rebalancing following the effective date of the change, provided the announcement is made on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the listing status change is made at the following month-end rebalancing.
Default	Securities in legal default are removed at the next month-end rebalancing following the default event, provided the event occurs on or before three business days before the last business day of the month (rebalancing lock-out date). Otherwise the security is removed at the following month-end rebalancing. The security is removed from the index at the market price on the date of removal.

# Synthetic security indices

## US Constant Maturity STRIP Index Series

Each Index tracks the performance of a single synthetic US Treasury STRIP purchased at the beginning of the month, held for one month, and then sold at the end of the month with the proceeds rolled into a new instrument. Therefore, on the purchase date, the bond has a maturity exactly equal to the stated maturity of the Index, and at the point it is sold it is one month short of the Index stated maturity.

The synthetic STRIP has a zero coupon, a purchase yield equal to the yield of the corresponding point on the coupon STRIP curve, and a purchase price which is derived from the purchase yield. The coupon STRIP curve is fitted from the observed prices of all outstanding US Treasury coupon STRIPs. Each day thereafter, the instrument is priced by discounting its cash flow at the current day's coupon STRIP curve, while taking account of the passage of time. At the end of the month, the security is sold and the proceeds are rolled into a new instrument with a maturity equal to the stated maturity of the Index.

## Deposit Rate Constant Maturity Index Series

Each Index tracks the performance of a synthetic asset paying a short-term deposit rate to a stated maturity. The Index is based on the assumed purchase at par of a synthetic instrument having exactly its stated maturity and with a coupon equal to that day's fixing rate. That issue is assumed to be sold the following business day (priced at a yield equal to the current day fixing rate) and rolled into a new instrument.

The following example illustrates the calculation of a Libor constant maturity Index over a period of three days using the US Dollar 1-Month Deposit Offered Rate Constant Maturity Index (ticker LUS1) on January 8, 2008, as an example. On January 7, a new instrument is purchased at par, with a coupon equal to the quoted Libor rate, 4.441%. On January 8, we calculate the current market price of that security based on a yield equal to the new quoted Libor rate of 4.411%. Using the current day "market price" and a starting value of par, we calculate price return, in this case 0.002%. Income return is accrued on a 30/360 basis and equals 0.012%. That instrument is then assumed to be sold and a new security is created, again priced at par and with a coupon equal to the quoted Libor rate for January 8 of 4.411%. On January 9, we repeat the process. Security 2 is sold at the current market price and a new instrument is purchased at par. Therefore, the average maturity of a 3-month deposit rate Index is always three months, a 1-month deposit rate Index is always one month, and an overnight Index is always one day.

## Tradeable Swap Index Series

Each Index tracks the performance of a funded investment that combines a short term asset earning a 1-month deposit bid rate with a par or zero coupon interest rate swap, of an equal notional value, where the Index pays floating and receives fixed. The tenor of the swap is matched to the stated maturity of the Index on the day the position is established. The two instruments are held for one month at which point the swap is rolled into a new maturity and the cash is reinvested.

### Valuation of the par or zero coupon swap

The swap is priced using discount functions derived from the par or zero coupon swap curve. Observed rates that form the basis for constructing the par coupon swap curve include a combination of closing futures prices and mid-market closing swap rates. All swap calculations assume regular settlement (i.e., T+2 for USD and EUR and T+0 for GBP).

### Valuation of the short term cash asset

Cash, in an amount equal to the notional value of the swap, is invested in a short term asset earning the 1-month deposit bid rate. The coupon for the short term asset is equal to the yield of the ICE BofAML 1-Month Deposit Bid Rate Constant Maturity Index for the corresponding currency on the day it is

purchased and the maturity is set to the settlement date associated with the next rebalancing date. The short term asset is priced at par and accrues interest daily using the same settlement date as the corresponding swap (i.e., T+2 for USD and EUR and T+0 for GBP).

### Rebalancing procedures

The Index is rebalanced on the last business day of the month. If the last calendar day of the month falls on a non-business day, the Index value for that date is equal to the Index value on the last business day. On the rebalancing day, cash is invested in a new asset earning the current day 1-month deposit bid rate, the old swap position is unwound and a new swap position is established so that the fixed leg of the swap once again matches the stated maturity of the Index.

## Yield/spread boundary conditions

We follow a two-step process to address securities that are very close to their call dates or have extreme values, both negative and positive:

1. If the YTW is negative, the calculated workout date is within 30 days and the bond is continuously callable, YTW will be recalculated using a workout date 60 days from the current date. Yield, spread, duration and convexity to worst will all be based on this second calculation. No further recalculation is done if the second YTW result is also negative.
2. If any yield calculations (to worst, to maturity, effective), after adjustments that may have taken place in step 1, fall outside of a +100%/-10% range they will be adjusted to the closest boundary (-10% or +100%). Likewise, if any spread (to worst, OAS vs Govt, OAS vs Swap and Asset Swap Spread) falls outside of a +10,000bp/-1,000bp range it will be adjusted to -1,000bp or +10,000bp. No changes will be made to the corresponding duration or convexity calculations for bonds that have yield and/or spread adjustments applied based on this rule.

## Sinking fund securities

To-maturity calculations (yield, duration and convexity) are calculated to the “average life” based on the sinking fund schedule. To-worst calculations are based on a comparison of the average life yield and the yield to all early redemption dates, if any. For example, if the yield to call is 3% and the yield to average life is 4%, the YTW will be 3% and the spread to worst will be calculated to the call date. If the yield to call is 5% and the yield to average life is 4%, the YTW will be 4% and the spread to worst will be calculated to the average life date.

## U.S. MBS cohort construction and identifier assignment

Individual pools are grouped into constituent cohorts based on agency/Government Sponsored Enterprise (GSEs) (Fannie, Freddie, Ginnie), product (30 year, 20 year, 15 year), coupon and production year. These four attributes are used to derive the cohort's identifier that appears in the CUSIP field. The identifier that appears in the ISIN field is then derived by using the identifier provided under the CUSIP field preceded by “US” and followed by “00”.

1st - 3rd characters: Agency and Product	Translation
FGI	Freddie Gold 15-yr
FGL	Freddie Gold 30-yr
FGT	Freddie Gold 20-yr

1st - 3rd characters: Agency and Product	Translation
FNI	Fannie 15-yr
FNL	Fannie 30-yr
FNT	Fannie 20-yr
G2S	Ginnie II 30-yr
GNJ	Ginnie 15-yr
GNS	Ginnie 30-yr
G2J	Ginnie II 15-yr
4th - 6th characters: Coupon	Translation
050	5.00%
052	5.25%
055	5.50%
057	5.75%
7th & 8th characters: Production Year	Translation
03	2003
04	2004

# Calculation formulas

## Calculating Index values

The daily closing Index value is a function of the prior month-end Index value and the current month-to-date return:

$$IV_n = IV_0 \times (1 + TRR_n)$$

where:

$IV_n$  = closing Index value on day  $n$

$IV_0$  = closing Index value on prior month-end

$TRR_n$  = month-to-date Index total return on day  $n$

The month-to-date return of an Index ( $TRR_n$ ) is equal to the sum of the individual constituent returns times their respective beginning of month weights:

$$TRR_n = \sum_{i=1}^k B_i TRR_{ni} \times B_i Wgt_0$$

where:

$TRR_n$  = Index month-to-date total return on day  $n$

$B_i TRR_{ni}$  = month-to-date total return on day  $n$  of bond  $i$

$B_i Wgt_0$  = beginning of month weight of bond  $i$

Periodic returns between any two dates can be derived from the beginning and end of period Index values. Since Index values represent closing levels, period returns will include market movement on the end of period date but exclude market movement on the beginning of period date. Therefore, to capture returns for the month of June, divide the June 30 Index value by the May 31 Index value:

$$TRR = \frac{IV_n}{IV_0} - 1$$

where:

$TRR$  = periodic total return

$IV_n$  = closing Index value on the end of period date

$IV_0$  = closing Index value on the beginning of period date

Annualized returns are derived from period total returns:

$$AnnTRR_n = (1 + TRR_n)^{365/d} - 1$$

where:

$AnnTRR_n$  = annualized total return for period  $n$

$TRR_n$  = periodic total return for period  $n$

$d$  = number of actual days in period  $n$

## Rules for calculating Index values on holidays

- Weekdays on which WM Company/Reuters does not publish closing FX rates are treated as “Global Holidays”.
- No Indices are published on Global Holidays unless a Global Holiday falls on the last calendar day of the month.
- All Indices are published on global business days and the last calendar day of every month.
- If the last calendar day of a month falls on a Global Holiday, prices are updated in all local markets that are open. Prices in all markets that are closed are rolled from the prior business day and accrued interest is calculated for the new settlement date.
- If the last calendar day of the month falls on a weekend, all prices are rolled from the last business day and accrued interest is calculated for the new settlement date.

## Calculating bond total returns in local currency terms

Month-to-date total returns are calculated daily for each bond in its currency of denomination (i.e., local total return). Cash flows from bond payments that are received during the month are retained in the Index as a separate line item until the end of the month and then are removed as part of the rebalancing. Cash does not earn any reinvestment income while it is held in the Index. With the exception of US mortgage pass-through and US structured products (ABS, CMBS and CMOs), accrued interest is calculated assuming next calendar day settlement (including when the next calendar day is a non-business day). Accrued interest for US mortgage pass-through and US structured products is calculated assuming same-day settlement.

$$BTRR_n = \frac{(P_n + AI_n) - (P_0 + AI_0) + C \times \left(1 + \frac{r}{d}\right)^t}{P_0 + AI_0}$$

where:

$BTRR_n$  = individual bond month-to-date total return on day  $n$

$P_n$  = current day price

$P_0$  = prior month-end price

$AI_n$  = current day accrued interest

$AI_0$  = prior month-end accrued interest

$C$  = coupon payments received during the period (including capital payments at current market value)

$r$  = reinvestment rate (currently zero)

$t$  = number of days between the receipt of the cash flow and day  $n$

$d$  = day count convention for reinvestment asset

## Calculating inflation-linked security total returns in local currency terms

Month-to-date total returns for inflation-linked securities are calculated daily for each bond in its currency of denomination (i.e., local total return). Inflation-linked returns include the impact of the change in inflation factor over time. Cash flows from bond payments that are received during the month are retained in the Index as a separate line item until the end of the month and then are removed as part of the rebalancing. Cash does not earn any reinvestment income while it is held in the Index. Accrued interest is calculated assuming next calendar day settlement (including when the next calendar day is a non-business day).

$$BTRR_n = \frac{f_n \left( P_n + AI_n + C * \left( 1 + \frac{r}{d} \right)^t \right) - f_0(P_0 + AI_0)}{f_0(P_0 + AI_0)}$$

where:

$BTRR_n$  = individual bond month-to-date total return on day  $n$

$f_n$  = current day inflation factor

$f_0$  = prior month-end inflation factor

$P_n$  = current day price

$P_0$  = prior month-end price

$AI_n$  = current day accrued interest

$AI_0$  = prior month-end accrued interest

$C$  = coupon payments received during the period (including capital payments at current market value)

$r$  = reinvestment rate (currently zero)

$t$  = number of days between the receipt of the cash flow and day  $n$

$d$  = day count convention for reinvestment asset

# Calculating convertible security total returns in local currency terms

Month-to-date total returns are calculated daily for each bond in its currency of denomination (i.e., local total return). Convertible returns include the impact of conversions/redemptions which occur during the month. Cash flows from bond payments that are received during the month are retained in the Index as a separate line item until the end of the month and then are removed as part of the rebalancing. Cash does not earn any reinvestment income while it is held in the Index. Accrued interest is calculated assuming next calendar day settlement (including when the next calendar day is a non-business day).

$$BTRR_n = \frac{(1 - f_n)(P_n + AI_n) + C * \left(1 + \frac{r}{d}\right)^t}{(P_0 + AI_0)} - 1$$

$$C = I_c + AI_c + R_c$$

where:

$BTRR_n$  = individual bond month-to-date total return on day  $n$

$f_n$  = percentage reduction in face on day  $n$

$P_n$  = current day price

$P_0$  = prior month-end price

$AI_n$  = current day accrued interest

$AI_0$  = prior month-end accrued interest

$C$  = cash received during the period including coupon payments as well as capital payments at current market value

$I_c$  = interest/dividend payments received during the period

$AI_c$  = current day redemption accrued, defined as the percentage change in face times accrued interest paid, if any

$R_c$  = current day principal cash, defined as the percentage change in face times the redemption price

$r$  = reinvestment rate (currently zero)

$t$  = number of days between the receipt of the cash flow and day  $n$

$d$  = day count convention for reinvestment asset

# US mortgage pass-through total return formula

$$TRR = \frac{\left( (P_n + AI_n) - (P_0 + AI_0) + \left[ \frac{C}{12} \times \left( 1 + \frac{r}{d \times 100} \right)^t \right] \right)}{P_0 + AI_0} + (1 - f) \times \frac{\left[ \left( 100 \times \left( 1 + \frac{r}{d \times 100} \right)^t \right) - (P_n + AI_n) \right]}{P_0 + AI_0}$$

$$f = (1 - SPP) \times (1 - SMM)$$

$$SMM = 1 - \left( 1 - \frac{CPR}{100} \right)^{1/12}$$

$$SPP = \left( \frac{\frac{WAC_0}{1200}}{\left( 1 + \frac{WAC_0}{1200} \right)^{WAM_0} - 1} \right)$$

where:

$TRR$  = month to date total return

$P_n$  = current day price (assuming cash settlement)

$P_0$  = prior month-end price (assuming cash settlement)

$AI_n$  = current day accrued interest (assuming cash settlement)

$AI_0$  = prior month-end accrued interest (assuming cash settlement)

$C$  = net coupon stated in percentage terms

$r$  = reinvestment rate stated in percentage terms (currently zero)

$d$  = day count for reinvestment asset

$t$  = time to/since cash flow payment date (settlement date minus cash flow payment date)

$SPP$  = schedule principal payment percentage

$SMM$  = single monthly mortality

$CPR$  = most recently reported constant prepayment rate

$WAC_0$  = weighted average gross coupon rate as of the previous month stated in percentage terms

$WAM_0$  = remaining maturity (in terms of number of months) as of the previous month

# US mortgage pass-through cash settlement price calculation

US mortgage pass-through cash settle prices are derived from the current month regular (forward) settlement price up to the date before the roll date using the following formula:

$$P_c = \left[ (P_r + AI_r) \times \left( \frac{1}{\left( 1 + \frac{r}{d \times 100} \right)^n} \right) \right] - AI_c$$

where:

$P_c$  = cash settle price

$P_r$  = regular (forward) settle price for current month settlement

$AI_c$  = cash settle accrued interest

$AI_r$  = regular (forward) settle accrued interest for current month settlement

$r$  = 1-month Libid stated in percentage terms

$n$  = number of days between cash settle date and regular (forward) settle date

$d$  = number of days in the year based on Libor daycount convention (360)

US mortgage pass-through cash settle prices are derived from the next month regular (forward) settlement price on the roll date through the end of the month using the following formula:

$$P_c = \left[ \left( \frac{C}{12} + 100 \times (1 - f_e) \right) \times \left( \frac{1}{\left( 1 + \frac{r}{d \times 100} \right)^{n_1}} \right) \right] + \left[ (P_r + AI_r) \times f_e \times \left( \frac{1}{\left( 1 + \frac{r}{d \times 100} \right)^{n_2}} \right) \right] - AI_c$$

where:

$P_c$  = cash settle price

$P_r$  = regular (forward) settle price for next month settlement

$AI_c$  = cash settle accrued interest

$AI_r$  = regular (forward) settle accrued interest for next month settlement

$r$  = 1-month Libid stated in percentage terms

$n_1$  = number of days between cash settle date and the next month cash flow payment date

$n_2$  = number of days between cash settle date and regular (forward) settle date

$C$  = net coupon stated in percentage terms

$f_e$  = estimated factor based on most recently reported actual CPR

$d$  = number of days in the year based on Libor daycount convention (360)

## US ABS, CMBS and CMO total return formula

$$TRR = \frac{(P_n + AI_n) - (P_0 + AI_0) + (P_{CF} + I_{CF}) \left(1 + \frac{r}{d \times 100}\right)^t}{(P_0 + AI_0)} - \frac{(1-f)(P_n + AI_n)}{(P_0 + AI_0)}$$

where:

$TRR$  = individual bond month-to-date total return

$P_n$  = current day price (assuming cash settlement)

$P_0$  = prior month-end price (assuming cash settlement)

$AI_n$  = current day accrued interest (assuming cash settlement)

$AI_0$  = prior month-end accrued interest (assuming cash settlement)

$I_{CF}$  = interest cash flow received

$P_{CF}$  = principal cash flow received

$f$  = end of period factor divided by the beginning of period factor

$r$  = reinvestment rate (currently zero)

$t$  = number of days between the receipt of the cash flow and day  $n$

$d$  = day count convention for the reinvestment asset

## Converting returns into another base currency unhedged

Unhedged returns are converted into a given base currency using the following formulas:

$$CRR = \frac{FX_n}{FX_0} - 1$$

$$TRR_{converted} = [(1 + TRR_{local}) \times (1 + CRR)] - 1$$

where:

$CRR$  = currency return

$FX_n$  = end-of-period FX rate (stated in terms of the number of units of the base currency per one unit of the currency of denomination of the bond)

$FX_0$  = beginning-of-period FX rate (stated in terms of the number of units of the base currency per one unit of the currency of denomination of the bond)

$TRR_{converted}$  = total return of the bond converted into the base currency unhedged

$TRR_{local}$  = local total return of the bond

## Converting returns into another base currency hedged

Currency hedged Index returns assume a rolling 1-month forward hedge where forward contracts are purchased in an amount equal to the full market value of the Index (including accrued interest) at the

beginning of the month. In addition to the formulas used to calculate unhedged converted returns, hedged returns require the following additional formulas:

$$CRUTRR = CRR \times (1 + TRR_{local})$$

$$FCR = \frac{FWD_0}{FX_0} - 1$$

$$HR = HPct \times (FCR - CRR)$$

$$TRR_{hedged} = TRR_{local} + CRUTRR + HR$$

$$HIV_n = HIV_0 \times (1 + TRR_{hedged})$$

Where:

*CRUTRR* = currency return on unhedged local total return

*FCR* = forward contract return

*FWD<sub>0</sub>* = beginning-of-period forward rate (stated in terms of the number of units of the base currency per one unit of the currency of denomination of the bond)

*HR* = hedge return

*HPct* = percentage hedged

*TRR<sub>hedged</sub>* = total return hedged into the base currency

*HIV<sub>n</sub>* = closing hedged Index value on day *n*

*HIV<sub>0</sub>* = closing hedged Index value on prior month-end

## Sample hedged return calculation

The following example illustrates the December 2005 hedged return calculation for the ICE BofAML Euro Government Index (EG00) hedged into CHF

EG00 Hedged Index Value 30-Nov-05: 301.565

EG00 Local Total Return December 2005: 1.061%

EUR/CHF FX Rates:

1-mo Forward Rate 30-Nov-05 = 1.547892

Spot Currency Rate 30-Nov-05 = 1.549907

Spot Currency Rate 31-Dec-05 = 1.554588

Currency Return

$$\begin{aligned} &= (\text{End Spot Rate} / \text{Begin Spot Rate}) - 1 \\ &= (1.554588 / 1.549907) - 1 \\ &= 0.302\% \end{aligned}$$

Converted Return (unhedged)

$$\begin{aligned} &= [(1 + \text{Local Total Return}) \times (1 + \text{Currency Return})] - 1 \\ &= [(1 + 1.061\%) \times (1 + 0.302\%)] - 1 \\ &= 1.366\% \end{aligned}$$

Currency Return on Unhedged Local Total Return

$$\begin{aligned} &= \text{Currency Return} \times (1 + \text{Local Total Return}) \\ &= 0.302\% \times (1 + 1.061\%) \end{aligned}$$

$$= 0.305\%$$

#### Forward Contract Return

$$\begin{aligned} &= (\text{Begin 1-mo Forward Rate} / \text{Begin Spot Rate}) - 1 \\ &= (1.5479892 / 1.549907) - 1 \\ &= -0.130\% \end{aligned}$$

#### Hedge Return

$$\begin{aligned} &= \% \text{hedge} * (\text{Forward Contract Return} - \text{Currency Return}) \\ &= 1.00 * (-0.130\% - 0.302\%) \\ &= -0.432\% \end{aligned}$$

#### Converted Return (Hedged)

$$\begin{aligned} &= \text{Local Total Rtn} + \text{Currency Rtn on Unhedged Local Total Rtn} + \text{Hedge Rtn} \\ &= (1.061\%) + (0.305\%) + (-0.432\%) \\ &= 0.934\% \end{aligned}$$

#### Hedged Index Value 31-Dec

$$\begin{aligned} &= \text{Hedged Index Value 30-Nov} * (1 + \text{MTD Hedged Return 31-Dec}) \\ &= 301.565 * (1 + 0.934\%) \\ &= 304.381 \end{aligned}$$

Note: small differences in the above calculations may result from rounding.

# Return attribution methodology

A decision to purchase a bond brings with it many different types of risk. A corporate bond, for example, holds the obvious exposure to the credit worthiness of the issuer. But it also contributes to the aggregate interest rate exposure of the portfolio. On top of that, inclusion of a call, put or sinking fund feature may mean an additional element of optionality risk. And finally, depending on the currency of denomination of the cash flows, there may be foreign exchange risk to contend with as well. This complicates the bond selection process, as a particular issue under consideration may look very attractive from one risk perspective (eg, the issuer and spread), but go counter to the desired risk profile of the portfolio in other respects (eg, duration, currency, etc.). As a result, the portfolio manager is constantly working to make the individual positions in the portfolio fit together like an intricate jigsaw puzzle so as to achieve a portfolio profile that, in the aggregate, is aligned with both market views and tolerance levels for each of the major sources of risk.

Performance measurement – the periodic comparison of portfolio returns to those of a selected benchmark Index – provides an excellent macro level view of results, but offers little by way of explanation as to how those results were achieved. Performance attribution is a critical portfolio management technique in which each of the major sources contributing to overall portfolio performance is identified. Performance attribution requires a model for determining how much of a bond's return is affected by key risk factors.

**Chart 1: Sources of risk in fixed income securities**

# Decomposing asset returns by source

Return attribution is a process by which the total return of a bond, portfolio, or Index is decomposed into a series of primary risk/return factors. The Index return attribution model has identified six key factors<sup>2</sup>, summarized in Table 1, each of which isolates the degree to which changes in a specific market variable contributed to the total return of a bond. The starting point for the attribution process is the bond's beginning price, accrued interest, spread and implied volatility. There are a number of ways to define spread – we use option-adjusted spread<sup>3</sup> (OAS) as the basis for the model as it allows us to measure bonds with and without embedded options (eg, call, put, or sink features) in common and consistent terms. We then calculate a series of theoretical prices for the bond by sequentially changing a single pricing assumption while holding all other variables constant until we get to the ending price. A more detailed explanation of the step by step derivation of the factor prices is provided below.

## Factor 1: Coupon

Coupon Return measures the contribution to total return of the stated coupon currently in effect. Price is held constant and accrued interest is recalculated to the end of period date. The change in price (always zero since price is held constant) plus the change in accrued interest along with coupons received during the period, if any, divided by the beginning price plus accrued interest is the Coupon Return. An obvious limitation to the explanatory power of Coupon Return is that it does not reflect the automatic change in price that occurs with the passage of time as premium and discount bonds converge to par while approaching maturity. This can amount to a significant portion of price movement for any bond priced at a steep premium or discount – particularly zero coupon and deferred interest bonds. Factor 2, Amortization/Roll, captures the impact of par convergence, thereby allowing for a more complete measure of the net interest return of a bond.

## Factor 2: Amortization/Roll

Amortization<sup>4</sup>/Roll return measures the degree to which a bond's price changed simply due to the passage of time. The settlement date is changed to the end of the measurement period, and a theoretical price is derived using the beginning of period OAS, yield curve and implied volatility. The difference between the theoretical Amortization/Roll price and the beginning price divided by the beginning price plus accrued interest is the Amortization/Roll return. Shifting settlement date forward will affect the price of a bond in three ways:

1. Cash flows are closer to their maturity, which means that associated present values converge toward par.
2. Since the cash flows are closer to maturity, the corresponding discount rates are taken from a slightly shorter point on the yield curve. Therefore, in a normal yield curve environment cash flows are discounted at progressively lower rates, while the reverse is true in an inverted yield curve environment.
3. In the case of bonds with embedded options, the change in settlement date will affect the time value of the option.

Together, Coupon and Amortization/Roll Return measure the net interest return of a bond.

---

<sup>2</sup> For US mortgage backed securities, one additional factor, "MBS Principal Paydown", is required. Refer to Table 1 for more detail on the US Mortgage attribution model

<sup>3</sup> Option-adjusted spread is the number of basis points that the fair value government spot curve is shifted in order to equate a bond's discounted cash flows with its market price. See "Option-adjusted spreads" for more detail.

<sup>4</sup> We have abbreviated the Factor 2 label as "Amortization/Roll" return. This attribution factor, however, includes the accretion of discount as well as amortization of premium bonds.

### **Factor 3: Curve Shift**

Curve Shift return measures the degree to which a bond's price changed as a result of shifts in the general level of interest rates. To establish the amount that the yield curve has shifted, we take an average of the yield changes along the fair value government par coupon curve from year 2 to year 30 (see "Fair value yield curves"). This shift factor is then added to the beginning yield curve and a theoretical Curve Shift price is derived using the beginning OAS and implied volatility along with the shifted yield curve. The difference between the theoretical Curve Shift price and the theoretical Amortization/Roll price divided by the beginning price plus accrued interest is the Curve Shift return.

### **Factor 4: Curve Reshape**

Curve Reshape return measures the degree to which a bond's price changed as a result of changes in the shape of the fair value government yield curve. A theoretical Curve Reshape price is derived using the beginning OAS and implied volatility along with the actual ending yield curve. The difference between the theoretical Curve Reshape price and the theoretical Curve Shift price divided by the beginning price plus accrued interest is the Curve Reshape return.

### **Factor 5: Volatility Change**

Volatility Change return measures the degree to which a bond's price changed as a result of changes in implied volatility. A theoretical Volatility Change price is derived using the beginning OAS along with the actual ending yield curve and implied volatility. The difference between the theoretical Volatility Change price and the theoretical Curve Reshape price divided by the beginning price plus accrued interest is the Volatility Change return.

### **Factor 6: Spread Change**

Spread Change return measures the degree to which a bond's price changed as a result of changes in its spread to the government curve. In theory, the theoretical Spread Change price is derived using the actual ending yield curve, OAS and implied volatility. Since it is the last factor, however, we can eliminate this step as the theoretical price calculated in this manner will equal the actual ending price of the bond. Thus, the difference between the actual ending price of the bond and its theoretical Volatility Change price divided by the beginning price plus accrued interest is the Spread Change return.

**Table 1: Description of the Index Return Attribution Model**

Return Factor	Description	Calculation Methodology
<b>Coupon</b>	The return attributed to that portion of the nominal coupon earned or received during the period.	Coupons received during the period plus the change in accrued interest divided by the starting price plus accrued interest (other than US MBS, ABS and CMBS, also equal to total return minus price return).
<b>MBS Principal Paydown<sup>3</sup></b>	The return of a mortgage security attributed to the receipt of scheduled and unscheduled principal payments at par.	Paydown return equals par minus the ending price plus ending accrued interest divided by the starting price plus accrued interest times the percentage of outstanding principal repaid during the period.
<b>Amortization/Roll</b>	The portion of price return attributed to the passage of time. This includes the amortization of premium bonds and the accretion of discount bonds along with the effect on the present value of a bond's cash flows as they "roll down the yield curve".	Calculate the Option-Adjusted Spread <sup>1</sup> (OAS) of the bond at the beginning of the measurement period. Next, change settlement to the end of period date, and using the beginning yield curve, OAS and implied volatility solve for price. The difference between the "Amortization/Roll" price and the beginning price divided by beginning price plus accrued interest is the Amortization/Roll return. (Note: for mortgage securities, the prepayment model is used to generate a new set of projected cash flows for the new settlement date, but based on the old yield curve and volatility assumptions.)
<b>Curve Shift</b>	The impact on a bond's price resulting from general changes in the level of interest rates defined as the average parallel shift in the government fair value yield curve <sup>2</sup> .	Price is recalculated using the beginning OAS and implied volatility along with the starting yield curve plus the parallel shift amount. The parallel shift amount is equal to the average change in the fair value government par coupon curve (from 2 to 30 years). The difference between the "Curve Shift" price and the "Amortization/Roll" price divided by beginning price plus accrued interest is the Curve Shift return. (Note: for mortgage securities, the prepayment model is used to generate a new set of projected cash flows based on the old volatility assumptions and the starting yield curve plus parallel shift amount.)

**Table 1: Description of the Index Return Attribution Model**

Return Factor	Description	Calculation Methodology
<b>Curve Reshape</b>	The impact on a bond's price resulting from changes in the shape of the fair value government par coupon yield curve <sup>2</sup> .	Price is recalculated using the beginning OAS and implied volatility along with the actual ending yield curve. The difference between the "Curve Reshape" price and the "Curve Shift" price divided by beginning price plus accrued interest is the Curve Reshape return. (Note: for mortgage securities, the prepayment model is used to generate a new set of projected cash flows based on the old volatility assumptions and the ending yield curve).
<b>Volatility Change</b>	The impact on the price of a security resulting from changes in implied volatility.	Price is recalculated using the beginning OAS along with the ending yield curve and implied volatility. The difference between the "Volatility Change" price and the "Curve Reshape" price divided by beginning price plus accrued interest is the Volatility Change return. (Note: For U.S. Mortgages, the prepayment model is used to generate a new set of projected cash flows based on the ending yield curve and new volatility assumptions.)
<b>Spread Change</b>	The change in price resulting from changes in spread.	The difference between the actual ending price and the "Volatility Change" price divided by beginning price plus accrued interest is the Spread Change return.
<b>Total Return</b>	The sum of all of the above return factors. (Note: Since the above factors do not take currency into account, the sum of these factors is equal to the local currency return.)	Ending Price plus accrued interest minus beginning price plus accrued interest, plus any coupon payment and/or principal paydown received during the period, divided by beginning price plus accrued interest.

1 Option-adjusted spread is the number of basis points that the fair value government spot curve is shifted in order to equate a bond's discounted cash flows with its market price. See "Option-adjusted spread" for more detail.

2 The German government fair value curve is used as the baseline for purposes of attributing returns for all EUR-denominated bonds. The U.S. Treasury fair value curve excludes all on the run notes and bonds. See "Fair value yield curves" for more detail.

3 MBS Principal Paydown applies to US mortgage back securities.

# Excess return methodology

Excess return is a measure of relative value that neutralizes the interest rate and yield curve risk of a bond, thereby isolating that portion of its performance that is attributed solely to credit and optionality risks. Excess return is equal to a bond's total return minus the total return of a risk-matched basket of governments or interest rate swaps. There are two main components to excess return:

1. the additional interest income that accrues to the security during the period as a result of a higher starting yield relative to duration-matched governments or swaps, and
2. the effect of any change in spread during the period on the relative price movement of the security versus risk-matched governments or swaps.

The hedge basket is comprised of fair value governments (or swaps) that together are key rate duration-matched to the bond at six key nodes: the 6-month, 2-year, 5-year, 10-year, 20-year and 30-year points on the curve. The hedge basket is also matched to the bond's currency of denomination. For example, a sterling-denominated corporate bond is compared to UK Gilts or sterling interest rate swaps.

## Calculating key rate durations

The key rate duration calculation is similar to calculating effective duration but the par coupon yield curve is shifted at only one node at a time while the other five nodes are held unchanged. The shift amounts for the points on the curve in between the node that is shifted and the preceding and subsequent nodes are linearly interpolated (Chart 2). The sum of a bond's six key rate durations will, in most cases, closely match its effective duration.

**Chart 1: Shifting the curve at each key rate duration node**

# Creating fair value government and swap hedge securities

The governments (or swaps) used to construct the hedge basket are synthetic securities that are derived from the par coupon fair value government (or swap) yield curve in each market<sup>5</sup>. At the beginning of each month (ie, the last calendar day of the preceding month), a series of synthetic securities are created for 6-month, 2-year, 5-year, 10-year, 20-year and 30-year points on the curve. On that day, each synthetic security is priced at par, has a coupon and yield equal to the corresponding rate (in semi-annual terms) for the comparable maturity point on the fair value curve, and has an interest accrual date equal to the beginning of period date. Since these are initially par coupon securities priced exactly at the par coupon fair value curve, 100% of the hedge security's key rate duration exposure will fall on the node that corresponds to its maturity on the start date.

## Weighting the key rate duration-matched basket

At the beginning of each month (i.e., the last calendar day of the preceding month), a key rate duration-matched basket of fair value synthetic government (or swap) securities is created for each Index constituent. Each par coupon government (or swap) in the hedge basket (and the residual cash position) has key rate duration exposure at only one of the six nodes, whereas a constituent bond will typically have exposure at several nodes. The key rate duration of each hedge security, times its percentage weight, equals the constituent bond key rate duration for that corresponding node. For example, on November 30, 2013, the USD-denominated AIG 4.125% 2/24 issue had an 8.043 key rate duration exposure to the 10-year node (Table 2). That exposure was matched by allocating 89.041% of the government hedge basket to the 10-year fair value US Treasury security, which had an 9.032 key rate duration at that node ( $9.032 \times 89.041\% = 8.043$ ). The sum of the hedge basket key rate durations and the AIG key rate durations both equal 8.552, which also matches the AIG effective duration.

**Table 2: AMER INTL GRP 4.125 2/24 excess return hedge basket as of November 30, 2013**

KRD node	AIG KRD	Fair value par coupon government bond hedge basket						weight	Wgt KRD
		Cash	6mo	2yr	5yr	10yr	20yr		
Cash	0.000	0.000						-1.729%	0.000
6mo	0.010		0.418					2.472%	0.010
2yr	0.071			1.912				3.735%	0.071
5yr	0.256				4.808			5.334%	0.256
10yr	8.043					9.032		89.041%	8.043
20yr	0.172						14.971	1.146%	0.172
Total	8.552								8.552

<sup>5</sup> Euro and euro legacy currency denominated securities are compared to synthetic fair value governments based on the German government curve. The U.S. Treasury fair value curve excludes the current and previous on-the-run notes and bonds from its sample population. All markets exclude callable governments from the sample population. See "Fair value yield curves" for more detail.

## Calculating excess return

Over the course of the month, the fair value government (or swap) securities roll down the curve and are priced by discounting their cash flows at the corresponding spot rates that are derived from the par coupon fair value yield curve. A total return is then calculated for each security in the hedge basket and multiplied by its beginning weight. The sum of the weighted hedge security total returns is subtracted from the constituent bond total return to arrive at the excess return. In the AIG example discussed previously, the 10-year fair value government bond began the month with a maturity of exactly 10-years and a price of 100.00. At the end of the month it had a remaining maturity of 9 years and 11 months, and was priced by discounting its cash flows using the December 31, 2013 spot curve. That produced a -2.079% total return for that security. The product of the hedge security returns and their respective weights equaled -1.949%. The AIG total return was -1.245%, leaving an excess return of +0.704%.

**Table 3: AMER INTL GRP 4.125 2/24 excess return for December 2013**

Term	Start value 30-Nov-13	End value <sup>1</sup> 31-Dec-13 (PV of cash flows)	Weight 30-Nov	Hedge basket total return
Cash			-1.73%	0.01%
6 mo	100	100.017272	2.47%	0.02%
2yr	100	99.828209	3.74%	-0.17%
5yr	100	98.668987	5.33%	-1.33%
10yr	100	97.921493	89.04%	-2.08%
20yr	100	98.15202	1.15%	-1.85%
Hedge basket total return				-1.95%
AMER INTL GRP 4.125 2/24 total return				-1.25%
AMER INTL GRP 4.125 2/24 excess return				0.70%

<sup>1</sup> Ending value is based synthetic bond cash flows discounted at the December 31, 2013 fair value government spot curve

The month-to-date excess return of an Index is equal to the weighted average of the individual excess returns of its constituents based on beginning of period weights.

$$ER_{Index} = \sum_{i=1}^k ER_i W_i$$

where:

$ER_{Index}$  = excess return of the Index

$ER_i$  = excess return of Index constituent bond  $i$

$W_i$  = beginning of month weight of Index bond  $i$

$k$  = the number of bonds in the Index

For annualized excess return the annualized total return of the hedge basket is subtracted from the annualized total return of the Index/bond.

# Fair value yield curves

## Government nominal yield curves

Fair value government spot yield curves are derived from a universe of bond prices using government Index constituents. Specifically, the zero discount function is parameterized as a linear combination of a family of exponential functions. When a coupon bond is stripped as a set of coupon and principle payments, each cash flow is discounted using this parameterized discount function and the optimal fit is obtained by minimizing the sum of the squares of the differences of the individual bond theoretical and actual prices:

$$obj = \min \sum_i \Delta P_i^2$$
$$\Delta P_i = P_i - \sum_j C_{ij} df_j$$

Where:

$P_i$  = the actual bond price,

$C_{ij}$  = the bond cash flows

$df_j$  = the discount function

The goodness of fit and stiffness of the curve can be adjusted by increasing or decreasing the number of exponential basis functions and the exponent parameter.

A closer look at the fitted values of long and short bond prices using this method shows that, while long and short bond price discrepancies are comparable, the fitted bond yield discrepancy deteriorates rapidly towards zero maturity, creating instability on the front of the fitted yield curve. That is due to the fact that the price of a very short duration bond is minimally sensitive to yield changes. For example, a 10bp move for a bond with only 3 months to maturity amounts to 0.025 price change, whereas the same move would translate into a 1.50 price change for a 15 year duration bond. Therefore any adjustment to the front end of the curve does not improve the objective function by much and therefore the method will do a better job fitting long yields than short yields.

For that reason, we modify the formula and look at both price and yield discrepancies, using a method that increases the weight of short duration bonds and improves the stability of the front end as follows:

$$obj = \min \sum_i \Delta P_i^2 + \Delta y_i^2$$

This can be restated as follows:

$$obj = \min \sum_i \Delta P_i^2 (1 + \Delta y_i^2 / \Delta P_i^2) = \min \sum_i \Delta P_i^2 w_i$$
$$w_i = 1 + \frac{1}{risk_i^2}$$

Where risk is the dollar risk of the bond ( $dP/dy_i$ )

Notes on security selection:

1. The US Treasury fair value curve excludes the current and previous on-the-run issues, any notes or bonds that are the cheapest to deliver for a futures contract, 30-year bonds with less than 10 years remaining term to maturity and 10-year bonds with less than 5 year remaining term to maturity.
2. The euro government fair value curve is comprised of all Index qualifying German government bonds.
3. All markets exclude callable governments from the sample population.

## Government real yield curves

Real yield curves are derived from inflation-linked bonds using the same principle that a single curve is used to discount all bonds' cash flows, all of which are stated in real terms. The real curve is bootstrapped from the observed market prices. As a result, the curve will exactly match the real yields of the observed inflation-linked securities and there will be no rich/cheap spreads. A bootstrap approach is used largely due to the fact there are comparatively fewer observed securities to work with than in the nominal bond markets. While the resulting curve accurately prices the bonds, it is not useful for purposes of comparing richness or cheapness of the observed securities.

## Corporate fair value curves

Our corporate spread curve model assumes that spread and spread duration are the two factors driving bond price movement. This greatly simplifies the relationship of a bond's price versus characteristics such as coupon, maturity, amortization, call schedule etc. Unlike other methods where price is directly modeled against the curve, and only bullet bonds can be used, our approach may use all bonds in a given Index universe. This is important in markets where a significant portion of outstanding bonds have embedded options.

We use the Nelson-Siegel model to build the corporate spread curves. It is a four-parameter formula that can account for the many shapes observed in the curvature of term structures. While this approach was originally applied to building traditional rate-maturity curves, we borrow the model and simply apply it to fitting OAS-duration curves.

The universe of bonds is pre-screened from the relevant Index universe (eg, US corporates, AA-rated). While ratings are updated only monthly for purposes of selecting constituents for rating sub-Indices, they are updated daily for purposes of determining observations for rating category corporate spread curves. Next, the median OAS and the average of deviates (the absolute difference of the OAS and median OAS) are calculated. A spread outside the band of four-times the average of deviates is excluded from the fitting. Finally, the parameters are adjusted to achieve an optimal solution by minimizing the sum of the square of the differences between the bonds and the fitted curve. The bonds are duration-weighted for purposes of calculating the best fit. In addition, depending on the curve, the bonds may be additionally market-weighted, or equal-weighted.

Once the OAS-duration curve is fit, it is just a matter of overlaying it on the underlying government curve to generate the resulting spot and par-coupon corporate yield curves. Since the corporate par curve is a function of maturity, an iterative process is applied to guarantee the resulting par curve is consistent with the OAS-duration curve. The iterative process adjusts the corporate par coupon rate at each maturity point to match the OAS-duration curve.

# Option-adjusted spread

## Fixed rate corporate and government bonds

Option-adjusted spread is the number of basis points that the fair value government spot curve is shifted in order to match the present value of discounted cash flows to the bond's price. For securities with embedded options, such as call, sink or put features, a log normal short interest rate model is used to evaluate the present value of the securities potential cash flows. In this case, the OAS is equal to the number of basis points that the short interest rate tree must be shifted in order to match discounted cash flows to the bond's price.

## Floating rate and fixed-to-floating rate corporate bonds

For floating rate and fixed-to-floating rate securities with embedded options (e.g., call, put, etc.), OAS is assumed to follow a Gaussian (normal) distribution based on a given spread volatility that is derived from the actual historical spread volatility (monthly spread volatility for currency-rating buckets is based on data from July 1998 with a 90% exponential decay – ie, a 5 year half-life) for the bond's peer group (summary rating category buckets within each currency of denomination). This randomized spread is added to the government interest rate tree to discount projected cash flows (based on the floating Index forward curve). The OAS is equal to the number of basis points that the short interest rate tree plus the randomized spread must be shifted in order to match discounted cash flows to the bond's price.

## Mortgage pass-through securities and CMOs

For US mortgage pass-through securities, interest rate/prepayment models are used to generate projected cash flows and forward curves (256 scenarios). OAS is the number of basis points that is added to the semi-annually compounded forward one-month rate curve to discount the corresponding cash flows for each scenario to arrive at a present value for each scenario. OAS is calculated in order to match the average of present values of all scenarios to the bond's price.

## Structured products (ABS and CMBS)

For US structured products, a projected cash flow is generated (single scenario) using the pricing speed (provided by IDC). OAS is the number of basis points that is added to the semi-annually compounded forward one-month rate curve in order to match the present value of cash flows to the bond's price.

## Floating rate ABS

For US floating rate ABS, yield is calculated based on the assumption that the current index rate will be constant over the remaining life of the bond. OAS is the number of basis points that is added to the semi-annually compounded forward one-month rate curve in order to match the present value of cash flows to the bond's price. For the OAS calculation, projected cash flows are based on the forward rate curve. Therefore, the coupon rate will vary over the remaining life of the bond.

# Composite rating algorithm

Index constituent composite ratings are updated once a month as part of the rebalancing process. Composite rating changes take effect on the last calendar day of the month based on information available up to and including the rebalancing lock-out date (the third business day prior to the last business day of the month). Rating upgrades or downgrades occurring after that day will not be considered in the current month rebalancing and will get incorporated at the following month's rebalancing.

For example, assuming there are no Global Holidays in between, if August 31 fell on a Friday the rebalancing lock-out date would occur on August 28. Therefore, a bond that was downgraded to below investment grade on August 28 would transition from the investment grade Index to the high yield Index at the August 31 rebalancing. Conversely, if the bond was downgraded on August 29, it would remain in the investment grade Index for the month of September and transition to high yield at the September 30 rebalancing.

Composite ratings are the simple averages of ratings from Moody's, S&P and Fitch. Ratings must be public and any expected or anticipated ratings are not used. The composite rating is calculated by assigning a numeric equivalent to the ratings in each agency's scale (Table 4). The average of the numeric equivalents for each agency that rates a bond is rounded to the nearest integer and then converted back to an equivalent composite rating using the scale in Table 4. If only two of the designated agencies rate a bond, the composite rating is based on an average of the two. Likewise, if only one of the designated agencies rates a bond, the composite rating is based on that one rating. Provisional or estimated ratings are excluded from the composite rating calculation.

**Table 4: Ratings scale for calculating composite rating**

Numeric	Composite	Moody's	S&P	Fitch
1	AAA	Aaa	AAA	AAA
2	AA1	Aa1	AA+	AA+
3	AA2	Aa2	AA	AA
4	AA3	Aa3	AA-	AA-
5	A1	A1	A+	A+
6	A2	A2	A	A
7	A3	A3	A-	A-
8	BBB1	Baa1	BBB+	BBB+
9	BBB2	Baa2	BBB	BBB
10	BBB3	Baa3	BBB-	BBB-
11	BB1	Ba1	BB+	BB+
12	BB2	Ba2	BB	BB
13	BB3	Ba3	BB-	BB-
14	B1	B1	B+	B+
15	B2	B2	B	B
16	B3	B3	B-	B-
17	CCC1	Caa1	CCC+	CCC+
18	CCC2	Caa2	CCC	CCC
19	CCC3	Caa3	CCC-	CCC-
20	CC	Ca	CC	CC
21	C	C	C	C
22	D		D	D

## Sample calculations

The following examples demonstrate the composite rating calculation for several Index constituents as of August 31, 2008 (rebalancing lock-out date = August 26, 2008):

- Coventry Health, CVH 5.95% March 15, 2017**  
 Moody's: Ba1 = 11  
 S&P: BBB = 9  
 Fitch: BBB- = 10  
 $(11 + 9 + 10) / 3 = 10 \Rightarrow BBB3$
- Tyson Foods, TSN 6.60% April 1, 2016**  
 Moody's: Ba1 = 11  
 S&P: BBB- = 10  
 Fitch: BB+ = 11  
 $(11 + 10 + 11) / 3 = 10.667 \Rightarrow 11 \Rightarrow BB1$

## Rating hierarchy for asset classes

While our composite rating is generally derived from individual bond ratings, in some cases other ratings are used as an alternative. Table 5 lists the rating types, in order of priority, used for each issuer group to calculate the composite rating. For example, if a government guaranteed security has a bond rating from at least one of the three designated agencies, then its composite rating will be based on the bond rating(s). If the bond is not rated by any of the three agencies, then issuer ratings from the three agencies are used as an alternative. On the other hand, corporate bonds only use bond ratings.

**Table 5: Hierarchy of rating types used by asset class**

Issuer group	Composite rating based on
Sovereigns (i.e., sovereign debt denominated in the issuer's local currency)	Local currency long term sovereign debt rating
Foreign Sovereigns (i.e., sovereign debt denominated in a foreign currency)	Foreign currency long term sovereign debt rating
Quasi-Governments (i.e., Agency, Local Authority, Government Sponsored/Guaranteed, Supranational)	1) Bond rating
	2) Senior unsecured debt issuer rating (foreign currency issuer rating is used for bonds denominated in a currency other than the local currency of the issuer's country of domicile). Note: issuer rating is used only for unsubordinated debt.
US Agency MBS and CMOs	Ginnie Mae collateral: US local currency long-term debt sovereign rating
	Fannie Mae & Freddie Mac collateral: senior unsecured debt issuer rating
Covered bonds	Bond rating
US Municipals	Bond rating
ABS and CMBS	Bond rating
Corporate bonds	Bond rating
Preferreds	Bond rating

# Subordination types

Subordination types indicating payment ranking are assigned to all corporate, quasi-government and securitized/collateralized securities in the Index universe. Table 6 lists the subordination types along with notes on the conventions followed.

**Table 6: Subordination type classifications**

Code	Description	Notes
Non-Bank sector corporate and collateralized		
SECR	Secured	Senior secured, collateralized and covered
SENR	Senior	Senior unsecured; unsubordinated
SUB	Subordinated	Ranking below senior debt; senior subordinated
JSUB	Junior subordinated	Ranking below other subordinated debt
PFD	Preferred	Ranking below junior subordinated debt but above common equity; preferred stock
Bank sector corporate		
SECR	Secured	Senior secured, collateralized
SENR	Senior	Senior unsecured; unsubordinated
T2	Tier 2	Subordinated; includes legacy lower tier 2
UT2	Upper Tier 2	Includes only legacy upper tier 2 debt
T1	Tier 1	Originally issued as qualifying tier 1 capital under the issuer's regulatory regime
AT1	Alternative Tier 1	Originally issued as additional tier 1 capital under issuer's regulatory regime
PFD	Preferred	Ranking below junior subordinated debt but above common equity; preferred stock
Securitized		
SSEN	Securitized senior	Senior tranche of a securitized deal
SSUB	Securitized subordinated	Subordinated tranche of a securitized deal
SMEZ	Securitized mezzanine	Mezzanine tranche of a securitized deal

# Country designation

Unless otherwise noted the standard country designation used in Indices is country of risk. The methodology for determining country of risk is as follows:

- Sovereign debt (both local and foreign currency debt): the country of risk is the same as the issuing country
- Agency and Local Authority debt: the country of risk is the country in which the obligor resides
- Supranational debt: the country of risk is “Supranational”
- Collateralized and securitized asset classes: the country of risk is based on the location of the underlying collateral
- Corporate debt: the country of risk is based on the physical location of the issuer’s operating headquarters with the following exceptions:
  - Holding company issuers are assigned a country of risk based on the location of the majority of operating assets. If no single country represents a majority of operating assets, or if this cannot be determined, the country of risk is the issuer’s operating headquarters
  - Bank branch issues are assigned the country of risk of the parent entity
- Securities with a guarantee are assigned the guarantor’s country of risk
- For indirect corporate and government issuers such as Sukuks and loan participation notes, the country of risk is based on the obligor
- Convertible securities are assigned the country of risk of the underlying equity. The equity country of risk is assigned in the same manner as Corporate debt as described above.

# Country status, region and code assignments

The ICE BofAML indices use standard ISO codes for country and currency designations. We also have developed a geographic schema to group countries by region and sub-region.

## Defining market status: Emerging vs Developed

A country is defined as a developed market if it is a member of the FX-G10, Western Europe or a territory of the US or Western Europe. The FX-G10 includes all Euro members, the US, Japan, the UK, Canada, Australia, New Zealand, Switzerland, Norway and Sweden. All other countries are emerging markets by definition.

Geographical Region	Geographical Sub-Region
Africa	North Africa
	Sub-Saharan Africa
Americas	Caribbean
	Central America
	North America
	South America
Asia/Pacific	East Asia
	Oceania
	South Asia
	Southeast Asia
Caucasus & Central Asia	Caucasus
	Central Asia
Europe	Central & Eastern Europe
	Western Europe
Middle East	Middle East
Multinational	Multinational
Supranational	Supranational

In the Emerging Markets index series sub-indices exist that segment constituents by country into three regions: Latin America; EMEA (Europe, Middle East, Africa) and Asia. For purposes of qualifying these regional sub-indices the following definitions are used:

- Latin America – all Emerging Markets countries in the Americas region
- EMEA (also referred to as CEEMEA) – all Emerging Markets countries in the Africa, Caucasus & Central Asia and Middle East regions, along with all Emerging Markets countries in the Central & Eastern Europe sub-region
- Asia – all Emerging Markets countries in the Asia/Pacific region

# Sector Classification Schema

The ICE BofAML Indices use a four-tier classification schema segmenting constituent securities by asset class (Level 1), group (Level 2), category (Level 3) and sub-category (Level 4). A description of the Sovereign, Quasi-Government and Corporate sectors can be found below, followed by a table of the entire schema.

## Sovereign

The Sovereign asset class is comprised of debt issued by an independent country's central government denominated in that country's official currency. There are no subdivisions of this asset class, so Sovereign is also a Level 2, 3, and 4 sector.

## Quasi & Foreign Government

The Quasi & Foreign Government asset class is comprised of debt issued by a range of sub-sovereign entities, but also includes debt issued by an independent country's central government denominated in a foreign currency. Government ownership, whether in whole or in part, is not a consideration for inclusion in this asset class. The Quasi & Foreign Government asset class does not have any Level 2 groups, but is divided into six Level 3 categories and 26 sub-categories, each described below.

### Agency

The Agency category is comprised of debt issued by entities associated with implementing policy on behalf of an independent country's central government. An Agency is an entity that meets the following conditions:

- Exclusively serves an explicit public policy purpose, where profitability is not the sole concern, though profit-maximization is not precluded; and
- Was created by a specific statute and at the behest of a government, even if subsequent legislation has allowed for its transformation into a stockholder owned company or other private entity.

Debt issued by central banks is assigned to the Agency sector except in cases where the central bank is acting as the primary issuing agent for the central government, in which case it is classified as Sovereign/Foreign Sovereign. The Agency sector includes debt of local government funding vehicles, which issue securities on behalf of local authorities. There are no subdivisions of this Level 3 category, so Agency is also a Level 4 sub-category.

### Foreign Sovereign

The Foreign Sovereign category is comprised of debt issued by an independent country's central government denominated in a foreign currency. There are no subdivisions of this category, so Foreign Sovereign is also a Level 4 sub-category.

### Government Guaranteed

The Government Guaranteed category is comprised of debt with an explicit guarantee from an independent country's central government. There are no subdivisions of this category, so Government Guaranteed is also a Level 4 sub-category.

## Local-Authority

The Local-Authority category is comprised of debt issued by sub-sovereign entities with jurisdiction over specific regions. The debt of local government funding vehicles, which issue securities on behalf of local authorities, is included in the Agency sector. There are no subdivisions of this category, so Local-Authority is also a Level 4 sub-category.

## Supranational

The Supranational category is comprised of debt issued by international agencies. There are no subdivisions of this category, so Supranational is also a Level 4 sub-category.

## U.S. Taxable Municipal

The U.S. Taxable Municipal category is comprised of debt issued by U.S. local governments that are subject to taxes in the U.S. This category is divided into 21 sub-categories corresponding to those of the U.S. Tax-Exempt Municipals asset class.

# Corporate

The Level 1 Corporate asset class is comprised of unsecured or secured debt obligations issued by corporations. Government control or ownership, whether in whole or in part, is not a consideration when determining inclusion in this asset class.

## Financial

The Level 2 Financial group includes Corporate securities issued by all banking, brokerage, finance, investment and insurance companies. The debt of financial and commodity exchanges is also included in the Financial group. The Financial group is further divided into three Level 3 categories: Banking; Financial Services; Insurance.

### Banking

The Level 3 Banking category is comprised of debt issued by deposit-taking companies. Also included in the Banking category are all entities regulated as banks, such as many U.S. broker/dealers and consumer lenders. There are no subdivisions of this Level 3 category, so Banking is also a Level 4 sub-category.

### Financial Services

The Level 3 Financial Services category is comprised of debt issued by brokers, exchanges, commercial and consumer lenders, leasing companies, and investment companies. This category also includes the financial data service providers. The Financial Services category is further divided into three Level 4 sub-categories: Brokerage; Cons/Comm/Lease Financing; Investments & Misc Financial Services.

#### *Brokerage*

The Level 4 Brokerage sub-category is comprised of debt issued by financial and commodity securities dealers whose primary line of business is fee-based securities transactions on behalf of clients.

#### *Cons/Comm/Lease Financing*

The Level 4 Consumer/Commercial/Lease Financing sub-category is comprised of debt issued by finance companies engaged in consumer and commercial lending and leasing.

#### *Investments & Misc Financial Services*

The Level 4 Investments & Miscellaneous Financial Services sub-category is comprised of debt issued by all forms of institutional investors, clearing houses, exchanges and data service providers.

## Insurance

The Level 3 Insurance category is comprised of debt issued by companies engaged in all aspects of the insurance business except for health insurance. The Insurance category is further divided into six Level 4 sub-categories: Insurance Brokerage; Life Insurance; Monoline Insurance; Multi-Line Insurance; P&C; and Reinsurance.

### *Insurance Brokerage*

The Level 4 Insurance Brokerage sub-category is comprised of debt issued by companies whose primary revenue is derived from fee-based insurance contract sales.

### *Life Insurance*

The Level 4 Life Insurance sub-category is comprised of debt issued by companies whose primary revenue is derived from direct sales of life insurance contracts.

### *Monoline Insurance*

The Level 4 Life Insurance sub-category is comprised of debt issued by companies whose primary revenue is derived from bond payment guarantees as a form of credit enhancement. Title guarantee insurance companies are also included in this sub-category.

### *Multi-Line Insurance*

The Level 4 Multi-Line Insurance sub-category is comprised of debt issued by companies where a substantial part of revenue comes from both Life and P&C business lines.

### *P&C*

The Level 4 P&C sub-category is comprised of debt issued by companies whose primary revenue is derived from direct sales of property and casualty accident insurance contracts.

### *Reinsurance*

The Level 4 Reinsurance sub-category is comprised of debt issued by companies whose primary revenue is derived from direct sales of various stop-loss insurance contracts to other insurers.

## Industrials

The Level 2 Industrials group includes Corporate securities issued by companies associated with the manufacture and distribution of goods. The Industrials group also includes companies engaged in various input markets, including raw materials and real estate. The Industrials group is further divided into 14 Level 3 categories and 56 Level 4 sub-categories.

## Automotive

The Level 3 Automotive category is comprised of debt issued by companies involved in the manufacture of automobiles and automotive components, including their captive finance subsidiaries. The Automotive category is further divided into three Level 4 sub-categories: Auto Loans; Auto Parts & Equipment; and Automakers.

### *Auto Loans*

The Level 4 Auto Loans sub-category is comprised of debt issued by captive finance subsidiaries of automobile manufacturers.

### *Auto Parts & Equipment*

The Level 4 Auto Parts & Equipment sub-category is comprised of debt issued by companies involved in the manufacture and distribution of both original equipment manufacturer (OEM) and aftermarket automotive components.

### ***Automakers***

The Level 4 Automakers sub-category is comprised of debt issued by automobile manufacturers.

## **Basic Industry**

The Level 3 Basic Industry category is comprised of debt issued by companies involved in the production of input factors and raw materials. Companies involved in construction are also included in this category. The Basic Industry category is further divided into six Level 4 sub-categories: Building & Construction; Building Materials; Chemicals; Forestry/Paper; Metals/Mining Excluding Steel; and Steel Producers/Products.

### ***Building & Construction***

The Level 4 Building & Construction sub-category is comprised of debt issued by companies involved in the both commercial and residential construction.

### ***Building Materials***

The Level 4 Building Materials sub-category is comprised of debt issued by companies involved in the production of raw materials such as sand, clay, gypsum, lime and aggregates, as well as processed materials such as cement, concrete and bricks. The Building Materials sub-category also includes the debt of manufacturers of building components and home improvement products, but excludes lumber and plywood which are included in the Forestry/Paper sub-category.

### ***Chemicals***

The Level 4 Chemicals sub-category is comprised of debt issued by companies involved in the production of commodity and specialty chemicals, including plastics and synthetic fiber as well as paints and pigments. Fertilizers, pesticides and other agricultural chemicals are also included in this sub-category.

### ***Forestry/Paper***

The Level 4 Forestry/Paper sub-category is comprised of debt issued by companies involved in the production of timber and lumber and all paper products excluding specialty paper packaging, which is included in the Packaging sub-category.

### ***Metals/Mining Excluding Steel***

The Level 4 Metals/Mining Excluding Steel sub-category is comprised of debt issued by companies engaged in the production or extraction of metals and minerals, excluding that of iron ore and steel producers. In addition to input and raw material companies, this sub-category includes manufacturers of highly engineered specialty metal components. Coal miners are also included in this sub-category.

### ***Steel Producers/Products***

The Level 4 Metals/Mining Excluding Steel sub-category is comprised of debt issued by companies engaged in the production or extraction of steel or iron ore, including that of manufacturers of specialized steel products.

## **Capital Goods**

The Level 3 Capital Goods category is comprised of debt issued by companies involved in the production of goods, components and equipment used in the manufacture or delivery of other goods and services. The Capital Goods category is further divided into four Level 4 sub-categories: Aerospace/Defense; Diversified Capital Goods; Machinery; and Packaging.

### ***Aerospace/Defense***

The Level 4 Aerospace/Defense sub-category is comprised of debt issued by companies involved in the manufacture of civil or military aerospace and defense equipment, parts and products. All defense contractors are included in this sub-category.

### ***Diversified Capital Goods***

The Level 4 Diversified Capital Goods sub-category is comprised of debt issued by companies involved in the production of a diverse range of industrial input products and components, but excludes that of aerospace/defense, machinery and packaging companies, which have their own sub-categories. All Industrial conglomerates are also included in this sub-category.

#### ***Machinery***

The Level 4 Machinery sub-category is comprised of debt issued by companies involved in the manufacture of industrial machinery and automation equipment. This sub-category also includes the debt of all manufacturers of farm and agricultural equipment.

#### ***Packaging***

The Level 4 Packaging sub-category is comprised of debt issued by companies involved in the manufacture of paper, metal, glass or plastic packaging and containers and container fittings.

## **Consumer Goods**

The Level 3 Consumer Goods category is comprised of debt issued by companies involved in the manufacture of goods sold directly to the end consumer. The Consumer Goods category is further divided into four Level 4 sub-categories: Beverage; Food – Wholesale; Personal & Household Products; and Tobacco.

#### ***Beverage***

The Level 4 Beverage sub-category is comprised of debt issued by companies involved in the production of consumable liquids, including brewers, distillers and vintners as well as producers of soft drinks, juices and mineral water.

#### ***Food – Wholesale***

The Level 4 Food – Wholesale sub-category is comprised of debt issued by companies involved in the growth, production, processing or distribution of consumable solids. This includes producers of meat, poultry or fish products, as well as producers of processed and packaged foods including dairy products, meats, poultry, fish and pet foods.

#### ***Personal & Household Products***

The Level 4 Personal & Household Products sub-category is comprised of debt issued by companies involved in the production of personal consumer and household products. This includes manufacturers of detergents, soaps, diapers and other household paper products as well as personal and beauty care products, including cosmetics and perfumes. This sub-sector also includes manufacturers of power and hand tools, as well as leisure products and equipment. Also included are manufacturers of houseware and durable household products, such as kitchenware and appliances. Excluded from this sub-sector are consumer electronics manufacturers, which are classified in the Level 4 Tech Hardware & Equipment sub-sector.

#### ***Tobacco***

The Level 4 Tobacco sub-category is comprised of debt issued by companies involved in the production of tobacco and tobacco products. Also included in this sub-category are manufacturers of vaping and marijuana products.

## **Energy**

The Level 3 Energy category is comprised of debt issued by companies involved in the production of oil and gas fuel. The Energy category is further divided into five Level 4 sub-categories: Energy – Exploration & Production; Gas Distribution; Integrated Energy; Oil Field Equipment & Services; and Oil Refining & Marketing.

### ***Energy – Exploration & Production***

The Level 4 Energy – Exploration & Production sub-category is comprised of debt issued by companies primarily involved in the upstream businesses of search, access and extraction of underground oil and gas reserves.

#### ***Gas Distribution***

The Level 4 Gas Distribution sub-category is comprised of debt issued by companies primarily involved in the midstream business of transporting and storing oil and gas. This includes companies running compressors, pipelines and terminals.

#### ***Integrated Energy***

The Level 4 Integrated Energy sub-category is comprised of debt issued by companies involved in both upstream and downstream oil and gas businesses.

#### ***Oil Field Equipment & Services***

The Level 4 Oil Field Equipment & Services sub-category is comprised of debt issued by companies involved in providing goods and services facilitating the extraction of oil and gas. This includes manufacturers of drilling rigs and equipment and providers of services to companies involved in the drilling, operating and maintenance of oil and gas wells.

#### ***Oil Refining & Marketing***

The Level 4 Oil Refining & Marketing sub-category is comprised of debt issued by companies involved in the downstream businesses of refining, processing, distribution and sale of oil and gas fuel.

## **Healthcare**

The Level 3 Healthcare category is comprised of debt issued by companies involved in the provision of medical products and services. The Healthcare category is further divided into five Level 4 sub-categories: Health Facilities; Health Services; Managed Care; Medical Products; and Pharmaceuticals.

#### ***Health Facilities***

The Level 4 Health Facilities sub-category is comprised of debt issued by operators of health care facilities, including hospitals, specialist outpatient clinics, nursing homes, rehabilitation and retirement centers and veterinary clinics.

#### ***Health Services***

The Level 4 Health Services sub-category is comprised of debt issued by companies providing health care services including dialysis, transportation, lab testing services, and pharmacy management services. This sub-sector also includes the debt of companies providing information technology and business support services to health care providers, such as records, diagnosis, imaging, consulting, clerical support and staffing services.

#### ***Managed Care***

The Level 4 Managed Care sub-category is comprised of debt issued by companies engaged in the operation of health maintenance organizations (HMOs) and other managed health plans.

#### ***Medical Products***

The Level 4 Medical Products sub-category is comprised of debt issued by manufacturers of health care equipment and devices, including medical instruments, drug delivery systems, diagnostic equipment, as well as cardiovascular and orthopedic devices. Also included in this sub-sector is debt issued by manufacturers and distributors of all other health care supplies and medical products.

### ***Pharmaceuticals***

The Level 4 Pharmaceuticals sub-category is comprised of debt issued by companies primarily engaged in the research, development or production of medicinal drugs, including veterinary drugs.

## **Leisure**

The Level 3 Leisure category is comprised of debt issued by companies involved in the full range of recreation and entertainment service businesses. The Leisure category is further divided into four Level 4 sub-categories: Gaming; Hotels; Recreation & Travel; and Theaters & Entertainment.

### ***Gaming***

The Level 4 Gaming sub-category is comprised of debt issued by operators of casinos and gaming facilities, including companies providing lottery and betting services.

### ***Hotels***

The Level 4 Hotels sub-category is comprised of debt issued by operators of hotels and hotel resorts, where room, board and hospitality services are the main business activity.

### ***Recreation & Travel***

The Level 4 Recreation & Travel sub-category is comprised of debt issued by theme parks and resorts, cruise lines, travel agencies, tour operators and related services. This sub-sector also includes debt issued by operators of all other leisure facilities, including sport and fitness centers, stadiums, golf courses and amusement parks.

### ***Theaters & Entertainment***

The Level 4 Theaters & Entertainment sub-category is comprised of debt issued by operators of cinemas, live theatres and concert venues as well as event promoters and production support service providers.

## **Media**

The Level 3 Media category is comprised of debt issued by companies primarily involved in the creation and distribution of creative content, as well as those involved in providing advertising services. The Media category is further divided into five Level 4 sub-categories: Advertising; Cable & Satellite TV; Media – Diversified; Media Content; and Printing & Publishing.

### ***Advertising***

The Level 4 Advertising sub-category is comprised of debt issued by companies providing advertising, marketing or public relations services.

### ***Cable & Satellite TV***

The Level 4 Cable & Satellite TV sub-category is comprised of debt issued by companies providing video content via fixed-line cable or satellite receiver.

### ***Media – Diversified***

The Level 4 Media – Diversified sub-category is comprised of debt issued by companies involved in more than one form of content creation or distribution, most frequently broadcasting and publishing.

### ***Media Content***

The Level 4 Media Content sub-category is comprised of debt issued by companies broadcasting or producing original creative material. This includes owners and operators of television or radio broadcasting systems, as well companies involved in creating original programming for radio and television. Also included in this sub-category is debt issued by companies making original filmed entertainment and video games.

### ***Printing & Publishing***

The Level 4 Printing & Publishing sub-category is comprised of debt issued by companies providing commercial printing and distribution services. This includes publishers of newspapers, magazines and books as well as all providers of information in print or electronic formats.

## **Real Estate**

The Level 3 Real Estate category is comprised of debt issued by companies engaged in real estate ownership, development or management. The Real Estate category is further divided into three Level 4 sub-categories: Housing Association; RealEstate Dev & Mgt; and REITs.

### ***Housing Association***

The Level 4 Housing Association sub-category is comprised of debt issued by companies involved in social housing projects, including military housing.

### ***RealEstate Dev & Mgt***

The Level 4 Real Estate Development & Management sub-category is comprised of debt issued by companies involved in diverse property-related activities including development and sales, as well as those operating real estate properties for the purpose of leasing & management.

### ***REITs***

The Level 4 REITs sub-category is comprised of debt issued by companies engaged in real estate as an investor, with a portfolio of properties managed for income and capital appreciation. The debt of companies legally established as a REIT, but whose primary business is not real estate are classified according to their primary business activity.

## **Retail**

The Level 3 Retail category is comprised of debt issued by companies engaged in selling goods directly to end consumers. Included in this category are issuers specializing in online and mail-order sales as well as those with physical locations. The Retail category is further divided into five Level 4 sub-categories: Department Stores; Discount Stores; Food & Drug Retailers; Restaurants; and Specialty Retail.

### ***Department Stores***

The Level 4 Department Stores sub-category is comprised of debt issued by operators of stores offering a wide range of consumer goods in different product categories, competing not just on lowest price but on brand and shopping experience.

### ***Discount Stores***

The Level 4 Discount Stores sub-category is comprised of debt issued by operators of stores offering merchandise at a lower price than competing stores, expecting to make up the difference on volume. This sub-category includes hypermarkets, supercenters and membership-based warehouse stores.

### ***Food & Drug Retailers***

The Level 4 Food & Drug Retailers sub-category is comprised of debt issued by operators of grocery stores, convenience stores, drug stores and pharmacies.

### ***Restaurants***

The Level 4 Restaurants sub-category is comprised of debt issued by operators of restaurants, bars, pubs, fast-food and take-out facilities.

### ***Specialty Retail***

The Level 4 Specialty Retail sub-category is comprised of debt issued by operators of any online and/or physical store specializing in a particular type of merchandise.

## Services

The Level 3 Services category is comprised of debt issued by companies engaged in providing a wide range of environmental, business and social support services. The Services category is further divided into two Level 4 sub-categories: Environmental and Support-Services.

### *Environmental*

The Level 4 Environmental sub-category is comprised of debt issued by companies providing environmental services, including waste management, recycling and pollution control services. This sub-sector excludes large-scale water treatment systems classified in the Non-Electric Utilities sub-sector.

### *Support-Services*

The Level 4 Support-Services sub-category is comprised of debt issued by companies engaged in a wide variety of business and consumer services. Services provided by companies in this sub-category include the following: rental; catering; cleaning and maintenance; storage and warehousing; human resources; education and training; engineering and consulting; prisons and corrections.

## Technology & Electronics

The Level 3 Technology & Electronics category is comprised of debt issued by manufacturers of electronic products and components, computer hardware and software. The Technology & Electronics category is further divided into three Level 4 sub-categories: Electronics; Software/Services; and Tech Hardware & Equipment.

### *Electronics*

The Level 4 Electronics sub-category is comprised of debt issued by companies manufacturing a wide variety of electronic products and components, including consumer electronics, semi-conductors, connectors, electron tubes, capacitors and resistors, electronic coil, printed circuit board, transformers and inductors.

### *Software/Services*

The Level 4 Software/Services sub-category is comprised of debt issued by companies engaged in developing and producing software designed for specialized applications for the business or consumer market, including enterprise and technical software. Also included in this subsector is debt issued by companies engaged in developing and producing systems and database management software, as well as developing and marketing internet software and/or providing internet services including online databases.

### *Tech Hardware & Equipment*

The Level 4 Technology Hardware & Equipment sub-category is comprised of debt issued by companies manufacturing computers, computer components, as well as equipment for telecommunications, networking and business productivity.

## Telecommunications

The Level 3 Telecommunications category is comprised of debt issued by companies engaged in the transmission of voice, data and video communications. The Telecommunications category is further divided into three Level 4 sub-categories: Telecom - Satellite; Telecom - Wireless; and Telecom – Wireline Integrated & Services.

### *Telecom – Satellite*

The Level 4 Telecom - Satellite sub-category is comprised of debt issued by companies engaged in transmitting communications via satellites.

### *Telecom – Wireless*

The Level 4 Telecom – Wireless sub-category is comprised of debt issued by companies that are primarily providers of cellular or wireless telecommunication services.

### ***Telecom – Wireline Integrated & Services***

The Level 4 Telecom – Wireline Integrated & Services sub-category is comprised of debt issued by companies that are providers of fixed-line telecommunication services, or offer both fixed-line and wireless services. Also included in this sub-sector are internet service providers, connectivity and networking service providers, as well as data center operators.

## **Transportation**

The Level 3 Transportation category is comprised of debt issued by companies engaged in transporting or facilitating the movement of people and merchandise. The Transportation category is further divided into four Level 4 sub-categories: Air Transportation; Rail; Transport Infrastructure/Services; and Trucking & Delivery.

### ***Air Transportation***

The Level 4 Air Transportation sub-category is comprised of debt issued by companies engaged primarily in passenger and goods transportation via airplanes.

### ***Rail***

The Level 4 Rail sub-category is comprised of debt issued by companies engaged in passenger and goods transportation via railroad.

### ***Transport Infrastructure/Services***

The Level 4 Transport Infrastructure/Services sub-category is comprised of debt issued by companies engaged in a wide range of activities relating to the transportation of passengers and goods. This sub-category includes companies engaged in the operation of ports and marine transportation, airports, storage and logistics facilities, as well as roads, tunnels and railtracks.

### ***Trucking & Delivery***

The Level 4 Trucking & Delivery sub-category is comprised of debt issued by companies engaged in goods transportation via land, but also includes all courier, package and mail delivery providers.

## **Utility**

The Level 2 Utility group includes Corporate securities issued by all companies involved in generating and transmitting electricity as well as providing water, sewer and gas services to end consumers. There are no subdivisions of this Level 2 category at Level 3, so Utility is also a Level 3 category. The Level 3 Utility category is further divided into four Level 4 sub-categories: Electric-Distr/Trans; Electric-Generation; Electric-Integrated; and Non-Electric Utilities.

### ***Electric-Distr/Trans***

The Level 4 Electric-Distribution/Transmission sub-category is comprised of debt issued by companies primarily engaged in the sale and delivery of electricity to end consumers.

### ***Electric-Generation***

The Level 4 Electric-Generation sub-category is comprised of debt issued by companies primarily engaged in the generation and sale of electricity, and includes alternative-source generators such as those using wind and solar energy.

### ***Electric-Integrated***

The Level 4 Electric-Integrated sub-category is comprised of debt issued by companies engaged in both the generation and distribution of electricity.

### ***Non-Electric Utilities***

The Level 4 Non-Electric Utilities sub-category is comprised of debt issued by companies engaged in the supply of water, sewer and gas services to end consumers.

Deposit rates	Rate dependent: bid, offer or mid	ICE Data Services	Local market close; 11:00am London (ICE)
Spot and forward FX rates	Mid	The WM Company	4:00pm London

## Glossary

**Table 9: Index glossary**

Field name	Definition
# of Issues	See Number of Issues.
\$ Market value (USD terms)	The full market value of the Index constituent securities converted into USD terms. It does not include cash payments received during the month and retained by the Index. See Market Value ex Cash.
% Excess Return vs. AAA Muni	The total return percentage of a bond minus the total return percentage of a risk-matched basket of Muni AAA GOs. The Muni AAA GO basket is comprised of synthetic securities derived from the fair value Muni AAA GO yield curve. The hedge basket is key rate duration-matched to the bond at six nodes: 6-month, 2-year, 5-year, 10-year, 20-year and 30-year. The excess return of an Index is equal to the average of its constituent security excess returns, weighted by their full market values as of the beginning of the period.
% Excess Return vs. Governments	See Excess Return % vs Govts.
% Excess Return vs. Muni	See % Excess Return vs. AAA Muni.
% Excess Return vs. Swap	See Excess Return % vs Swaps.
% Hedged	The percentage of the Index full market value at the beginning of the measurement period that is hedged into a given base currency using currency forwards, with 100% indicating fully hedged returns and 0% indicating unhedged returns. See Hedge Return Percentage.
% Market value	The sum of the full market values of all bonds within a given segment of the Index divided by the sum of the full market values of all bonds in the entire Index, including cash payments received during the period and retained by the Index. See % Weight.
% of	The full market value, including cash payments received and retained, of a selected Index divided by the full market value of another selected Index. (Note: if the first Index is a sub-Index whose constituents are completely contained within the second Index (ie, its parent), then the "% of" field shows the sub-Index share of the parent Index. If some or all of the first Index's constituents are not constituents of the second Index, the "% of" calculation simply shows the relative size of the two Indices.)
% Price return	See Price Return Percentage.
% Total return	See Total Return Percentage.

**Table 9: Index glossary**

Field name	Definition
% Weight	The full market value of a constituent bond (excluding any cash payments paid during the month) divided by the sum of the full market values of all constituent securities in an Index including all cash payments received during the month and retained by the Index.
Accrued Interest	For a bond, the accrued interest in percentage terms times the face value of the bond. For an Index, the sum of accrued interest values for all constituent securities.
Accrued Interest %	The interest earned on a bond, but not yet paid or received, through the settlement date stated as a percent of face value.
Accrued Interest Value	See Accrued Interest.
Asset Swap	An asset swap is a swap of a bond's fixed coupon for a floating rate coupon pegged to a short-term reference deposit rate. For a bond, asset swap spread is the spread over the forward swap curve that equates the present value of the floating rate instrument to the present value of the bond's cash flows where the cash flows of both instruments are discounted using the swap. The price of a bond with embedded options, such as call or put features, is adjusted to strip away the option value. Asset swap spread is calculated in semi-annual terms, regardless of the bond coupon frequency, as the fixed cash flows are always swapped against semi-annual floating payments. The reference basis for the short-term deposit rate is defined by market convention, with a 3-month rate used for USD while 6-month is used for EUR, GBP, etc. In addition, the swap is calculated on a par basis, meaning that a cash position is added to (removed from) a discount (premium) bond to adjust its price to 100. For an Index, the average of its constituent security asset swap spreads, weighted by full market value. All bond spreads are limited to a 10,000bp/-1,000bp range.
Base currency	The base currency that is used for purposes of calculating returns (which may be hedged or unhedged) and for conversion of bond/Index valuations such as face value, full market value, etc.
Beginning Index Value	The total return Index value (stated in local, converted unhedged or converted hedged terms) at the beginning of the measurement period. See Total Return Index Value.
Bond Ticker	See Ticker.
Calculation [method]	The basis on which yield and risk measures have been calculated. Conventional uses the bond's actual cash flow frequency as the basis for calculations. Semi-annual yield calculations assume a semi-annual compounding frequency. Semi-annual risk calculations (duration, convexity, etc.) are calculated by discounting the bond's actual cash flows using the semi-annual yield.
Cash	For a bond, cash is the amount received during the month from coupon payments plus interest on coupon payments received at the applicable reinvestment rate, if any, stated as a percentage of face value. For an Index it is the sum of the cash position (cash percentage times face value) for all constituent securities converted into a given base currency. For convertible securities it is the sum of Interest Cash, Principal Cash and Redemption Cash. (Note: when determining the weight of a constituent in an Index, cash is not included as part of the constituent's full market value, but it is included in the Index full market value.)

**Table 9: Index glossary**

Field name	Definition
Cash Value	See Cash.
Change in Govt OAS	The change in the Govt OAS during the period. For an Index, this includes the impact of rebalancing changes that occur during the period. See Govt OAS.
Change in Govt OAS (incl. rebalancing impact)	See change in Govt OAS.
Change in Libor OAS	The change in the Libor OAS during the period, inclusive of the impact of rebalancing changes that occur during the period. See Libor OAS.
Change in Libor OAS (incl. rebalancing impact)	See change in Libor OAS.
Change in Spread to Worst	The change in Spread to Worst during the period, inclusive of the impact of rebalancing changes that occur during the period. See Spread to Worst vs Govt.
Composite Rating	For a constituent bond, composite rating is the simple average of the Moody's, S&P and Fitch bond ratings. For an Index it is the average of its constituent security composite ratings, weighted by full market value.
Contribution to Modified Duration	The modified duration to maturity of a bond, or group of bonds, times its weight in a given Index. See Mod Dur to Maturity.
Contribution to modified duration to worst	The modified duration to worst of a bond, or group of bonds, times its weight in a given Index. See Mod Dur to Worst.
Conversion Premium	The excess of the convertible security's price above parity, expressed as a percentage. $\text{Conversion Premium} = (\text{Price} - \text{Parity}) / \text{Parity}$ . For an index it is the harmonic mean of the constituent security conversion premiums, weighted by full market value.
Convexity to Maturity	The second derivative of a security's price with respect to its yield divided by the security's price, where it is assumed that the bond will be redeemed at its final maturity date without regard to any embedded options such as call or put features. When Convexity to Maturity is stated in conventional terms, the bond cash flows to its final maturity date are discounted using its conventional yield. When stated in semi-annual terms, the bond cash flows to its final maturity date are discounted using its semi-annual yield. For an Index it is the average of its constituent security convexities to maturity, weighted by full market value.
Convexity to Worst	The second derivative of a security's price with respect to its yield divided by the security's price. For bonds with embedded options, such as call or put features, Convexity to Worst is calculated to the redemption date that produces the lowest yield for bonds with call features or the highest yield for bonds with put features (the "workout date"). When Convexity to Worst is stated in conventional terms, the bond cash flows to the workout date are discounted using its conventional yield. When stated in semi-annual terms, the bond cash flows to the workout date are discounted using its semi-annual yield. For an Index it is the average of its constituent security convexities to worst, weighted by full market value.

**Table 9: Index glossary**

Field name	Definition
Country of Risk	The International Organization for Standardization (ISO) country code of the issuer's country of risk. For corporate issuers the country of risk is based on the physical location of the issuer's operating headquarters, with several exceptions (see "Country designation" for full description)
Country of Risk (Eurozone Grouped)	The Country of Risk where all Eurozone countries are combined in a single group under the EURC code. See Country of Risk.
Country of Risk (Eurozone itemized)	The Country of Risk where all Eurozone countries are shown individually. See Country of Risk.
Coupon	For a bond, its stated rate of interest; for an Index the average of its constituent security coupons, weighted by full market value.
Credit Spread	For convertible securities, the credit spread input to the convertible risk model. For those convertible securities with an actual rating from the rating agencies the rating is used to reference an appropriate spread from the ICE Data Indices fair value credit curves. For unrated securities an implied rating is assigned.
Currency	The currency of denomination of the cash flows paid by a bond. Where used as a grouping category, Eurozone Grouped indicates that all euro legacy currencies are grouped under the EUR currency code while Eurozone Itemized indicates that euro legacy currencies are shown individually.
Currency of Denomination (Eurozone Grouped)	See Currency.
Currency of Denomination (Eurozone Itemized)	See Currency.
Currency Return	See Currency return percentage.
Currency return percentage	For an Index, currency return percentage in a given base currency is equal to the difference between the Index total return percentage in local currency terms and its total return percentage in the selected base currency.
Current Outstanding Face (LOC MM)	For convertible securities, the current face amount outstanding in local currency terms, in millions. This will be identical to the Face Value (see Face Value) in local currency terms, in millions, unless a redemption or conversion event has occurred.
Current Outstanding Face (USD MM)	For convertible securities, the current face amount outstanding in USD terms, in millions. This will be identical to the Face Value (see Face Value) in USD terms, in millions, unless a redemption or conversion event has occurred.
Current Yield	The annual coupon divided by the current price. For an index it is the average of the constituent security current yields, weighted by full market value.
Cusip	The Committee on Uniform Securities Identification Procedures number assigned by the CUSIP Service Bureau for U.S. and Canadian companies. For a bond that does not have an official Cusip number, the Bloomberg bond ID number is shown. In addition, where used as an input, the field will also accept Bloomberg bond ID numbers.

**Table 9: Index glossary**

Field name	Definition
Delta	For convertible securities the measure of equity sensitivity. Delta shows the relationship between a percentage change in the underlying equity and the corresponding expected percent change in convertible price. For an index, the average of each constituent security Delta, weighted by full market value.
Description	For a bond the issuer name; for an Index the official Index name.
Detail Composite Rating	See Composite Rating.
Effective Convexity	The second derivative of a security's price with respect to changes in the semi-annual par yield curve, divided by the security's price. For an Index it is the average of its constituent security effective convexities, weighted by full market value. See Effective Duration.
Effective Duration	Effective duration is the percentage change in the price of a bond given a parallel shift in the semi-annual par coupon government yield curve while keeping option-adjusted spread constant. A theoretical price is calculated by discounting the bond's cash flows using the shifted yield curve. An option pricing model is used to account for the impact of embedded options such as call or put features. For US mortgage-backed securities, prepayment and interest rate models are used to project security cash flows and the forward curve under multiple interest rate paths for the shifted yield curve scenario. For each interest rate path, the projected cash flows are discounted by the corresponding forward curve, plus the OAS derived from the base case, to arrive at a present value for the path. The average of the present values of all paths is the theoretical price for the scenario. For US ABS and CMBS securities, a single static set of cash flows are projected using an assumed pricing prepayment speed. For an Index, it is the average of its constituent security effective durations, weighted by full market value.
Effective Duration (OAD)	See Effective Duration.
Effective Yield	Effective yield is the yield of a hypothetical bullet bond created by stripping out the option value of a bond with embedded optionality such as a call or put features. For US ABS, CMBS and CMO securities, effective yields are based on a static set of cash flows generated using the assumed pricing prepayment speed. For US MBS, interest rate and prepayment models are used to project a set of future cash flows under a single interest rate scenario. The average life of the security is equal to the average time to each of the projected principal payments weighted by their future values. That average life is converted to a long-term equivalent PSA (ie, the PSA that will generate cash flows having the same average life) and the cash flows generated by the long-term equivalent PSA are used to derive the yield. For an Index, it is the average of its constituent security effective durations, weighted by full market value. All bond yields are limited to a +100%/-10% range.
Effective Yield (OAY)	See Effective Yield.
Ending Index Value	The total return Index value (stated in local, converted unhedged or converted hedged terms) at the end of the measurement period. See Total Return Index Value.
Equity Dividend Yield	For convertible securities the 12-month historical dividend of the underlying equity or equity basket divided by the current Equity Price.

**Table 9: Index glossary**

Field name	Definition
Equity ISIN	For convertible securities, the ISIN of the underlying equity as listed on its primary exchange.
Equity Market Cap (\$MM)	For convertible securities, the current market capitalization of the underlying equity, expressed in USD, in millions.
Equity Price	For convertible securities the price of the underlying equity or equity basket into which the security is exchangeable.
Equity Total Return Index Value	For convertible securities, a value tracking the performance of the underlying equity. The value is set to an arbitrary level (typically 100) at the inception of the security's presence in the index and thereafter is incremented or decremented by the total return percentage of the index. See Equity Total Return % MTD.
Equity Total Return % MTD	For convertible securities, the month-to-date total return of the underlying equity. It is equal to the month-to-date change in price plus any dividends received, divided by the beginning-of-month price. For an index, it is the average of its constituent total return percentages, weighted by the convertible security's full market values at the beginning of the month.
Equity Ticker	For convertible securities, the ticker of the underlying equity as listed on its primary exchange. For securities convertible into a basket of equities this field is populated with BASKET
Equity Volatility	For convertible securities, the one-year historical volatility of the underlying equity. This is used as an input to the convertible risk model.
Excess Return % vs Govts	The total return percentage of a bond minus the total return percentage of a risk-matched basket of governments. The government basket is comprised of synthetic securities derived from the fair value government yield curve corresponding to the currency of denomination of the bond. The hedge basket is key rate duration-matched to the bond at six nodes: 6-month, 2-year, 5-year, 10-year, 20-year and 30-year. The excess return of an Index is equal to the average of its constituent security excess returns, weighted by their full market values as of the beginning of the period.
Excess Return % vs Swaps	The total return percentage of a bond minus the total return percentage of a risk-matched basket of interest rate swaps. The swap basket is comprised of synthetic securities derived from the fair value swap yield curve corresponding to the currency of denomination of the bond. The hedge basket is key rate duration-matched to the bond at six nodes: 6-month, 2-year, 5-year, 10-year, 20-year and 30-year. The excess return of an Index is equal to the average of its constituent security excess returns, weighted by their full market values as of the beginning of the period.
Excess Return vs. Govt	See Excess Return % vs Govts.
Excess Return vs. Swap	See Excess Return % vs Swaps.
Excess Rtn % MTD	The month-to-date total return percentage of a bond minus the month-to-date total return percentage of a risk-matched basket of governments. See Excess Return % vs Govts.

**Table 9: Index glossary**

Field name	Definition
Face Value	For a bond, the face value of the security held by the Index. For capitalization weighted Indices, the face value of a constituent is equal to the total amount outstanding of the bond issue. For Indices that use alternative weighting schemes, the face value of a constituent will differ from the total amount outstanding of the bond issue. The Face Value of an Index is equal to the sum of the face values of its constituent securities converted into a given base currency.
Full Market Value	Full market value in local currency terms. (Note 1: for bonds, full market value is equal to face value times price plus accrued interest; for Indices, full market value also includes cash payments received and retained by the Index during the period. Note 2: euro legacy bonds are converted into EUR terms.)
Gamma	Measures the rate of change of Delta with respect to the underlying equity for convertible securities. Gamma is a measure of convexity and is the second derivative with respect to the underlying asset. For an index, the average of each constituent security Gamma, weighted by full market value.
Govt OAS	For a bond, the option-adjusted spread of the bond measured vs the underlying government yield curve corresponding to the bond's currency of denomination. Option-adjusted spread is the number of basis points that the fair value government spot curve is shifted in order to match the present value of discounted cash flows to the bond's price. For securities with embedded options, such as call, sink or put features, a log normal short interest rate model is used to evaluate the present value of the securities potential cash flows. In this case, the OAS is equal to the number of basis points that the short interest rate tree must be shifted in order to match discounted cash flows to the bond's price. For US mortgage-backed and CMO securities, interest rate/prepayment models are used to generate forward curves and project cash flows. OAS is the number of basis points that is added to the semi-annually compounded forward one-month rate curves to discount the corresponding cash flows for each scenario to arrive at a present value for each scenario. OAS is calculated in order to match the average of present values of all scenarios to the bond's price. For ABS and CMBS, a single interest rate scenario is used and the cash flows are generated using the pricing speeds. For an index, the average of its constituent security government option-adjusted spreads, weighted by full market value. All bond spreads are limited to a 10,000bp/-1,000bp range.
Hedge Return	See Hedge return percentage.
Hedge Return Percentage	For a bond or an Index, hedge return percentage in a given base currency is equal to the difference between the Index total return percentage fully hedged into a given base currency minus its unhedged total return percentage in that same base currency, times the percentage of the bond/Index currency exposure that has been hedged.
Implied Volatility	For convertible securities, the calculated equity volatility using the security's price. This is an output of the convertible risk model.
Implied Spread	For convertible securities, the calculated credit spread using the security's price. This is an output of the convertible risk model.

**Table 9: Index glossary**

Field name	Definition
Inception Date	The date that the Index history begins. It is typically earlier than the date the Index was first published, which is referred to as the Launch Date. See Launch Date.
Income Return %	The return of a bond or Index attributed to its coupon (including both received and/or accrued coupons, but not including amortization of premiums or accretion of discounts). Income return percentage is equal to total return percentage minus price return percentage. See Total Return Percentage, Price Return Percentage.
Income Return (Local)	See Income Return %.
Index Name	The official name of the Index.
Interest Cash	For convertible securities, the value of any interest or dividend payments received.
Investment Value	Also known as the bond floor, for convertible securities the level at which a straight bond with the same maturity and credit risk would be valued. Investment value effectively provides a "floor" for the price of the convertible if it loses all its equity content and trades as a fixed income instrument. For an index, the average of the constituent security investment values, weighted by face amount outstanding. Securities with mandatory conversion features are excluded from the index-level calculation.
Investment Value Premium	The premium of the convertible price above investment value, expressed as a percentage. For an index, the harmonic mean of constituent security investment value premiums, weighted by full market value. Securities with mandatory conversion features are excluded from the index-level calculation.
ISIN	The International Securities Identification Number (ISIN).
Is Mandatory	For convertible securities, the Is Mandatory field indicates whether the security has a mandatory conversion feature ("Y" or "N").
Issue Year	The year the security was issued.
Issuer Country	See Country of Risk.
Issuer State (U.S. munis)	The State in which a US municipal securities issuer is domiciled.
Launch Date	The date the Index was first published (not available for all Indices). It is typically later than the date the Index history begins, which is referred to as the Index Inception Date. See Inception Date.
Level 1 Asset Class	See Sector Level 1.
Level 2 Group	See Sector Level 2.
Level 3 Subgroup	See Sector Level 3.
Level 4 Detail	See Sector Level 4.
Leverage	Leverage for a convertible security is the ratio of the full value of the convertible bond to the value of a short position in the underlying equity, where the size of the short position is determined monthly based on the convertible security's delta. Leverage is also calculated for Delta-Hedged Indices based on the average of each constituent security Leverage, weighted by full market value.
Libor OAS	For a bond, the option-adjusted spread of the bond measured vs the underlying swap curve corresponding to the bond's currency of denomination. For an Index, the average of its constituent security Libor option-adjusted spreads, weighted by full market value. All bond spreads are limited to a 10,000bp/-1,000bp range.

**Table 9: Index glossary**

Field name	Definition
Mac Dur to Maturity	See Macaulay Duration.
Macaulay Duration	For a bond, the weighted average time to maturity of its cash flows without consideration given to embedded options such as call, put and/or sink feature. For an Index, it is the average of its constituent security Macaulay durations, weighted by full market value.
Market Convention Price	The price of a security as it is conventionally quoted.
Market Value Ex Cash	The sum of the market values of the constituent securities of an Index converted into a given base currency. Constituent security market values are equal to price plus accrued interest times face value. Market Value ex Cash does not include any coupon payments received during the period and retained by the Index.
Market Weighted Coupon	See Coupon.
Maturity	Generally Maturity is the final stated maturity of a constituent security. For fixed to floating rate securities it is the last call date during the fixed rate coupon period. For perpetual preferred securities it is 12/31/2200. For callable perpetual corporate securities it is the first call date. For US mortgage pass-through securities it is a date derived from the security's average life.
Mkt Wgt Coupon	See Coupon.
Mod Dur to Maturity	The percentage change in the price of a bond for a 100bp change in yield where it is assumed that the bond will be redeemed at its final maturity without regard to any embedded options such as call or put features. For an Index, it is the average of its constituent security modified durations to maturity, weighted by full market value. When duration to maturity is stated in conventional terms, the bond cash flows to maturity are discounted using its conventional yield. When stated in semi-annual terms, the bond cash flows to maturity are discounted using its semi-annual yield. For US ABS, CMBS and CMO securities, modified duration to maturity is based on a static set of cash flows generated using the assumed pricing prepayment speed. For US MBS, interest rate and prepayment models are used to project a set of future cash flows under a single interest rate scenario. The average life of the security is equal to the average time to each of the projected principal payments weighted by their future values. That average life is converted to a long-term equivalent PSA (ie, the PSA that will generate cash flows having the same average life) and the cash flows generated by the long-term equivalent PSA are used to derive the modified duration to maturity.

**Table 9: Index glossary**

Field name	Definition
Mod Dur to Worst	The percentage change in the price of a bond for a 100bp change in yield where it is assumed that bonds with embedded options, such as call or put features, will be redeemed on the redemption date that produces the lowest yield for bonds with call features or the highest yield for bonds with put features (the “workout date”). For an Index, it is the average of its constituent security modified durations to worst, weighted by full market value. When duration to worst is stated in conventional terms, the bond cash flows to the workout date are discounted using its conventional yield. When stated in semi-annual terms, the bond cash flows to the workout date are discounted using its semi-annual yield. For US ABS, CMBS and CMO securities, modified duration to worst is based on a static set of cash flows generated using the assumed pricing prepayment speed. For US MBS, interest rate and prepayment models are used to project a set of future cash flows under a single interest rate scenario. The average life of the security is equal to the average time to each of the projected principal payments weighted by their future values. That average life is converted to a long-term equivalent PSA (ie, the PSA that will generate cash flows having the same average life) and the cash flows generated by the long-term equivalent PSA are used to derive the modified duration to worst.
Modified Duration	The modified duration to maturity of a bond or Index stated in conventional terms. See Mod Dur to Maturity.
Modified Duration to Maturity	The modified duration to maturity of a bond or Index stated in conventional terms. See Mod Dur to Maturity.
Modified Duration to Maturity (Conventional)	The modified duration to maturity of a bond or Index stated in conventional terms. See Mod Dur to Maturity.
Modified Duration to Maturity (Semi-Annual)	The modified duration to maturity of a bond or Index stated in semi-annual terms. See Mod Dur to Maturity.
Modified Duration to Worst	The modified duration to worst of a bond or Index stated in conventional terms. See Mod Dur to Worst.
Modified Duration to Worst (Conventional)	The modified duration to worst of a bond or Index stated in conventional terms. See Mod Dur to Worst.
Modified Duration to Worst (Semi-Annual)	The modified duration to worst of a bond or Index stated in semi-annual terms. See Mod Dur to Worst.
Mortgage WAC	The weighted average coupon of the underlying mortgages that comprise a generic US mortgage pass-through security, weighted by their outstanding pool balances.
Mortgage WALA	The weighted average age of the underlying mortgages that comprise a generic US mortgage pass-through security, weighted by their outstanding pool balances.
Mortgage WAM	The weighted average maturity of the underlying mortgages that comprise a generic US mortgage pass-through security, weighted by their outstanding pool balances.
Nominal Amount	The denomination or face amount per security.
Number of Issues	The number of constituent securities in an Index or Index segment.
OAS vs Govt	See Govt OAS.
OAS vs Swap	See Libor OAS.
Option-adjusted spread (OAS)	See Govt OAS.

**Table 9: Index glossary**

Field name	Definition
Par Amount	See Face Value.
Par Amount (USD terms)	See Face Value.
Par Weighted Coupon	The average of the Index constituent security coupons, weighted by face value.
Par Weighted Price	See Price.
Par Wgt Coupon	See Par Weighted Coupon.
Par Wgt Price	See Price.
Parity	Also known as conversion value parity for convertible securities. Parity is equal to the conversion ratio times the underlying equity Stock Price divided by Nominal Amount.
Parity Delta	Parity delta is a measure of equity sensitivity for convertible securities showing the relationship between a nominal change in Parity and the corresponding expected nominal change in the convertible Price. It is the slope of the curve that relates the convertible security Price to its Parity. For an index, the average of each constituent security Parity Delta, weighted by full market value.
Parity Gamma	Measures the rate of change of Parity Delta with respect to the underlying equity for convertible securities. Parity Gamma is a measure of convexity and is the second derivative with respect to the underlying asset. For an index, the average of each constituent security Parity Gamma, weighted by full market value.
Payback	For convertible securities the premium recovery period. The number of years it takes for the convertible security's income advantage to offset the premium paid calculated using the dollar-for-dollar method: $\frac{(\text{Conversion Premium}) / (1 + \% \text{ Conversion Premium})}{\text{Current Yield} - \text{Stock Dividend Yield } \%}$ For an index, the average of constituent security Payback, weighted by full market value.
Paydown Return	See Paydown Return %.
Paydown Return %	For US MBS, ABS and CMBS securities, paydown return percentage represents the percentage change in value of the security attributed to the scheduled and prepaid principal received during the period. The portion of principal paid down will not participate in any price appreciation/depreciation during the period, but instead realizes a gain or loss equal to the difference between the end of period market price and par times the portion of face value that was paid down. For an Index, it is the average of its constituent security paydown return percentages, weighted by their full market values at the beginning of the measurement period.
Percent Cheap	For a convertible index the discount to Theoretical Value of constituent securities, weighted by full market value.
Price	The clean price of a bond stated as a percentage of face value. For an Index it is the average of its constituent security prices, weighted by face value.
Price Return (Local)	The Price Return Percentage during the measurement period in local currency terms. See Price Return Percentage.

**Table 9: Index glossary**

Field name	Definition
Price Return Index Hedged	A value that is set to an arbitrary level (typically 100) at the inception date of the Index and thereafter is incremented or decremented by the hedged price return percentage of the Index in a given base currency. See Inception Date, Price Return Percentage Hedged.
Price Return Index Value	A value that is set to an arbitrary level (typically 100) at the inception date of the Index and thereafter is incremented or decremented by the price return percentage of the Index. See Inception Date, Price Return Percentage.
Price Return Percentage	The price return percentage of a bond is equal to its change in price during the measurement period divided by its full market value at the beginning of the measurement period. If price return percentage is stated in a base currency other than the bond's currency of denomination, it also includes the impact of changes in spot currency rates during the period. For an Index, it is the average of its constituent security price return percentages, weighted by their full market values at the beginning of the period.
Price Return Percentage Hedged	The price return percentage of a bond or Index stated in a given base currency where the currency exposure of the bond/Index is hedged with currency forward contracts. See Price Return Percentage.
Principal Cash	For convertible securities, the value of any principal reduction due to early redemption or conversions.
Rating	See Composite Rating.
Redemption Cash	For a convertible security, the amount of accrued interest, if any, due from early redemption or conversion.
Redemption type	A flag that indicates the presence of any features of a bond that could affect its redemption date, such as a call or put feature.
Rho	Also known as bond delta, for convertible securities the correlation of movement between the convertible security Price and interest rates. For an index, the average of each constituent security Rho, weighted by full market value.
Sector Level 1	The first level of the four tier BofAML bond Index sector classification schema. Level 1 designates the sector asset class.
Sector Level 2	The second level of the four tier BofAML bond Index sector classification schema. Level 2 designates the sector group.
Sector Level 3	The third level of the four tier BofAML bond Index sector classification schema. Level 3 designates the sector category.
Sector Level 4	The fourth level of the four tier BofAML bond Index sector classification schema. Level 4 designates the sector sub-category.
Security Type	Indicates the basic market designation for a security: Government (Govt), U.S. Municipal (Muni), Corporate (Corp), Preferred (Pfd) or Collateralized/Securitized (Mtge) or Cash (CASH).
Spread	See Govt OAS.
Spread Duration	For a bond, the percentage change in price for a 100bp change in option-adjusted spread (OAS). For an Index it is the average of its constituent security spread durations, weighted by full market value.

**Table 9: Index glossary**

Field name	Definition
Spread to Worst vs Govt	For a bond, its yield to worst minus the yield at a point on the fair value government yield curve that corresponds to the bond's expected redemption date, where it is assumed that a bond with embedded options will be redeemed on the date that produces the lowest yield for bonds with call features or the highest yield for bonds with put features (the "workout date"). For US MBS, ABS, CMBS and CMO securities the average life is used in place of the expected redemption date. For an Index, the average of its constituent security spreads to worst, weighted based on full market value. See Yield to Worst. All bond spreads are limited to a 10,000bp/-1,000bp range.
Subordination Type	The ranking of the bond with regard to claims on issuer assets or earnings in the event of default.
SubType	See Subordination Type.
Summary Composite Rating (AAA, AA, etc)	Generic composite rating categories that do not distinguish rating sub-categories. For example, the AA Summary Composite Rating category includes bonds with a composite rating equal to AA1, AA2 or AA3. See Composite Rating.
Theoretical Value	The result from a model which assesses a convertible security as a sum of its parts: the embedded options plus the income portion. Among the assumptions used is a volatility measure based on the underlying equity and a credit spread, which we estimate based on implied or actual credit ratings. The credit spread used is option-adjusted spread (OAS) referenced from ICE Data Indices credit curves for the corresponding rating. For an index, the average of each constituent security Theoretical Value, weighted by face amount outstanding.
Ticker	For bonds, this field shows the issuer ticker; for Indices it is the four character BofAML reference ticker assigned to the Index.
Total Return (Converted)	The total return percentage of an Index times the percentage changes in spot currency rates where all constituent securities are converted into a common base currency. See Total Return Percentage.
Total Return (Local)	The total return percentage during the measurement period in local currency terms. See Total Return Percentage
Total Return Index Hedged	A value that is set to an arbitrary level (typically 100) at the inception of the Index and thereafter is incremented or decremented by the hedged total rate of return percentage of the Index in a given base currency. See Inception Date, Total Return Percentage Hedged.
Total Return Index Value	A value that is set to an arbitrary level (typically 100) at the inception of the Index and thereafter is incremented or decremented by the total return percentage of the Index. See Total Return Percentage.
Total Return Percentage	The Total Return Percentage of a bond is equal to the sum of its change in price, change in accrued interest, and cash flow payments received during the measurement period divided by its full market value at the beginning of the measurement period. If total return percentage is stated in a base currency other than the bond's currency of denomination, it is multiplied by in the percentage change spot currency rates during the period. For an Index, it is the average of its constituent security total return percentages, weighted by their full market values at the beginning of the period.

**Table 9: Index glossary**

Field name	Definition
Total Return Percentage Hedged	The total return percentage of a bond or Index stated in a given base currency where the currency exposure of the bond/Index is hedged with currency forward contracts. See Total Return Percentage.
Total Return Value	See Total Return Index Value.
TTR % MTD LOC	The month-to-date total return percentage in local currency terms. See Total Return Percentage.
Type	See Subordination Type.
Vega	For convertible securities the expected percentage change in Price given a 1% change in the volatility of the underlying equity. For an index, it is the average of each constituent security Vega, weighted by full market value.
Weight	See % Weight.
Weighting Method	The basis for determining the weights of constituent securities within an Index.
Years to Final Maturity	See Years to Maturity.
Years to Hard Call	For a convertible security with an issuer embedded call feature, the period of time in years to the next optional redemption. For an index, it is the average of each constituent security Years to Hard Call, weighted by full market value.
Years to Maturity	For a bond, the time from the current settlement date to its final stated maturity measured in years. For an Index, the average of its constituent security years to final maturity, weighted by full market value. For US MBS, ABS and CMBS constituents, years to maturity is equal to the security's average life.
Years to Maturity Average Life	See Years to Maturity.
Years to Maturity/Mand	For a convertible security the period of time in years to maturity or mandatory conversion. For an index, it is the average of each constituent security Years to Maturity/Mand, weighted by full market value.
Years to Workout	For a bond, the time from the current settlement date to the expected redemption date. For bonds with embedded options, such as call or put features, the expected redemption date is the date that produces the lowest yield for bonds with call features or the highest yield for bonds with put features. For an Index, the average of the constituent security years to workout weighted based on full market value.
Yield Advantage	The difference between the convertible security's Current Yield and the underlying equity's Equity Dividend Yield.
Yield Ratio	The effective yield of a bond divided by the yield on the effective duration-matched point on the fair value government yield curve that corresponds to the currency of denomination of the bond. For an Index it is the average of its constituent security yield ratios, weight by full market value.

**Table 9: Index glossary**

Field name	Definition
Yield to Maturity	For a bond, the percentage rate of return paid if the security is held to its maturity date without consideration given to any embedded options such as call or put features. When yield to maturity is stated in conventional terms, the bond cash flows to maturity are discounted using a yield based on the same coupon frequency of the bond. When stated in semi-annual terms, the bond cash flows to maturity are discounted using a semi-annual yield. For US MBS, ABS, CMBS and CMO securities, Yield to Maturity is equal to Effective Yield. For an Index, it is the average of its constituent security yields to maturity, weighted by full market value. All bond yields are limited to a +100%/-10% range.
Yield to Maturity (Conventional)	The yield to maturity of a bond or Index stated in conventional terms. See Yield to Maturity. All bond yields are limited to a +100%/-10% range.
Yield to Maturity (Semi-Annual)	The yield to maturity of a bond or Index stated in semi-annual terms. See Yield to Maturity. All bond yields are limited to a +100%/-10% range.
Yield to Put	For convertible securities with a put feature, the yield to the next put date. For an index, it is the average of each constituent security Yield to Put, weighted by full market value, where only those convertible securities with a put feature are included in the average.
Yield to Worst	For bonds with embedded options, yield to worst is the yield to the redemption date that produces the lowest result for bonds with call features or the highest result for bonds with put features. If the initially calculated yield to worst ("YTW") is negative, the calculated workout date is within 30 days and the bond is continuously callable, the YTW is recalculated using a workout date 60 days from the current date. When yield to worst is stated in conventional terms, the bond cash flows to the workout date are discounted using a yield based on the same coupon frequency of the bond. When stated in semi-annual terms, the bond cash flows to the workout date are discounted using a semi-annual yield. For US MBS, ABS, CMBS and CMO securities, Yield to Worst is equal to Effective Yield. For an Index, it is the average of the Yield to Worst of its constituent securities weighted by full market value. See Effective Yield. All bond yields are limited to a +100%/-10% range.
Yield to Worst (Conventional)	The yield to worst of a bond or Index stated in conventional terms. See Yield to Worst. All bond yields are limited to a +100%/-10% range.
Yield to Worst (Semi-Annual)	The yield to worst of a bond or Index stated in semi-annual terms. See Yield to Worst. All bond yields are limited to a +100%/-10% range.

# Disclaimer

The products and services mentioned herein solely in relation to the ICE BofAML Indices (each an “**Index**”) may not be available in all jurisdictions. This document does not constitute an offer of services in jurisdictions or circumstances where ICE Data Indices, LLC (“**IDI**”) does not have the necessary or appropriate licenses or approvals for the offering of the products and services described herein. Each Index provides a general investment strategy, does not take into account any of the specific needs or financial circumstances of any person, entity or group of persons and should not be considered investment advice. All information provided by IDI, including without limitation, any materials that describe any Index, is of general nature only.

The development or creation of any financial product that is based on, developed in connection with, or uses directly or indirectly any index of IDI, including any bi-lateral contract, fund, investment vehicle or issue of securities (an “**Investable Product**”), is prohibited without the prior written consent of IDI. IDI is not obligated to enter into or promote Investable Products or other transactions or investments that are linked to any ICE index or any of its constituents.

IDI receives compensation in connection with the licensing of its indices to third parties.

It is not possible to invest in an index directly. Exposure to an asset class or sector represented by an index or an interest the index seeks to measure may be available through Investable Products based on that index. IDI does not sponsor, endorse, sell, promote or manage, and has not reviewed or passed on the legality or suitability with respect to any person of, any Investable Product that is offered by third parties or any associated document, literature or publication, including without limitation, any prospectus or offering memorandum. IDI makes no assurance that Investable Products based on any **Index** will accurately track index performance or provide positive investment returns or not result in a loss of some or all of any investment in such Investable Products. IDI makes no representation regarding the advisability or suitability of investing in or assuming any risk in connection with any such Investable Products.

The products and services described herein may not be suitable for all purposes and for all investors and IDI makes no representation regarding (a) the level at which any Index stands at any particular time on any particular date, (b) the ability of any Index to track corresponding market performance (c) the results to be obtained by any party from the use of any Index or any data included in it for the purposes of issuing securities or carrying out any financial transaction or (d) any other matter.

A decision to invest in any Investable Product should not be made in reliance on any of the statements set forth in this document. Prospective investors should carefully consider, prior to making a decision to invest in any Investable Product, the risks associated with investing in such Investable Product, as detailed in an offering memorandum or similar document that is prepared by or on behalf of the issuer or obligor of the Investable Product and whether it is appropriate for their purposes and circumstances. Prospective investors should consult with an attorney, tax advisor, or accounting professional regarding any specific legal, tax, or accounting situation, or the impact of making any particular investment decision. Inclusion of a security within an index is not a recommendation by IDI to buy, sell, or hold such security, nor is it considered to be investment advice.

IDI is under no obligation to maintain or calculate any Index and may cancel or cease to calculate any Index without notice, subject to applicable regulation and its policies and procedures.

IDI does not assume any obligation or duty to any party in relation to any Index and under no circumstances does IDI assume any relationship of agency or trust or of a fiduciary nature for or with any party. Any calculations or determinations in respect of any Index or any part thereof will be made by IDI in accordance with the terms of its methodology at the relevant time and acting reasonably and in good faith.

Unless otherwise indicated, these materials have been prepared solely for informational purposes based upon information generally available to the public from source(s) believed to be reliable and are subject to change without notice. No content contained in these materials (including index data, ratings, credit-related analyses and data, model, software or other application or output therefrom) or any part thereof (“**Content**”) may be modified, reverse-engineered, reproduced or distributed in any form by any means, or stored in a database or retrieval system, without the prior written permission of IDI. The Content shall not be used for any unlawful or unauthorized purposes. In no event shall IDI have any liability (whether in negligence or otherwise) to any person in connection with such person's unauthorized use of any Index or Content.

Unless otherwise indicated, for the purpose of calculating any Index, IDI has relied on publicly available sources and has not independently verified the information extracted from these sources and accepts no responsibility or liability in respect thereof. IDI, its affiliates and its third-party providers and licensors and co-branding partners (where applicable) (collectively “**IDI Parties**”) do not guarantee that the Content is accurate, complete, timely or error free and it should not be relied upon as such. IDI Parties are not responsible for any errors, omissions, or interruptions regardless of the cause, or for the results obtained from the use of the Content.

THE CONTENT IS PROVIDED ON AN “AS IS” BASIS. In no event shall IDI Parties be liable to any party for any direct, indirect, incidental, exemplary, compensatory, punitive, special or consequential damages, costs, expenses, legal fees, or losses (including, without limitation, lost income or lost profits and opportunity costs) in connection with any use of the Index and/or Content even if advised of the possibility of such damages.

Any available index returns are hypothetical and do not represent the results of actual trading of Investable Products, and as such, do not represent actual past performance and are not indicative of any specific investment. The Content (including any of the output derived from any analytic tools or models) is not intended to predict actual results, which may differ substantially from those reflected. Past performance is not necessarily indicative of future results.

Intercontinental Exchange, Inc., the ultimate parent company of IDI, keeps certain activities of its business units separate from each other in order to preserve the independence and objectivity of their respective activities. As a result, certain business units of Intercontinental Exchange, Inc. may have information that is not available to other business units. IDI has established policies and procedures to maintain the confidentiality of certain non-public information received in connection with each analytical process. There is no obligation on IDI to disclose information held by it in relation to any Index to other parties.

The various businesses of Intercontinental Exchange, Inc. provide a wide range of products and services to a diverse group of clients and, as such, Intercontinental Exchange, Inc. faces potential conflicts of interest in the ordinary course of its business. Intercontinental Exchange, Inc. may be acting in a number of capacities in connection with Investable Products or other transactions entered into in relation to IDI. Intercontinental Exchange, Inc., acting in such capacities in connection with such transactions, shall have only the duties and responsibilities expressly agreed to by it in its relevant capacity and shall not, by virtue of its acting in any other capacity, be deemed to have other duties or responsibilities or be deemed to hold a standard of care other than as expressly provided with respect to each such capacity. IDI has established policies and procedures designed to identify and address conflicts of interest.

In addition, Intercontinental Exchange, Inc. provides a wide range of services to, or relating to, many organizations, including issuers of securities, investment advisers, broker-dealers, investment banks, other financial institutions and financial intermediaries, and accordingly may receive fees or other economic benefits from those organizations, including organizations whose securities may form part of any index or other evaluation IDI carries out.

**ABOUT INTERCONTINENTAL EXCHANGE** Intercontinental Exchange, Inc. (NYSE:ICE) operates a leading network of exchanges and clearing houses. ICE's exchanges and clearing houses, which include the New York Stock Exchange, serve global commodity and financial futures and equities markets. The New York Stock Exchange is the world leader in capital raising and equities trading. ICE is a leading provider of data services across global markets. Trademarks of ICE and/or its affiliates include Intercontinental Exchange, ICE, ICE block design, NYSE, New York Stock Exchange, and Interactive Data. Information regarding additional trademarks and intellectual property rights of Intercontinental Exchange, Inc. and/or its affiliates is located at <https://www.intercontinentalexchange.com/terms-of-use>. Other products, services or company names mentioned herein are the property of, and may be the service mark or trademark of, their respective owners.

**ABOUT ICE DATA SERVICES** ICE Data Services is part of Intercontinental Exchange (NYSE: ICE) and offers end-to-end solutions for information, analytics index services and connectivity, with a range of proprietary data and tools for global markets across fixed income, equities, commodities, FX and options.

ICE Data Services is the marketing name used for ICE Data Indices, Inc. and its subsidiaries globally, including ICE Data Pricing & Reference Data, LLC, Interactive Data (Europe) Ltd. and ICE Data Services Australia Pty Ltd. ICE Data Services is also the marketing name used for ICE Data Derivatives, Inc. and its subsidiaries globally, ICE Data Indices, LLC and certain other data products and services offered by other subsidiaries of Intercontinental Exchange, Inc. (NYSE:ICE).
