## Moody's Financial Monitor

# Current conditions mask risks that will crystallize when the cycle turns

*Moody's Financial Monitor provides our views on developments in financial markets and global banking systems, assessing systemic risks and potential asset bubbles, excessive leverage, market volatility and the strength and evolution of bank fundamentals.*

### Summary

- » **Market volatility returns as global trade tensions rise.** Global equity prices have rebounded from the turmoil in the spring but show signs of being weighed down by news on trade. Government bond prices have declined from high levels amid expectations of higher interest rates in the US and in other economies. Global housing prices are close to GDP-based averages, although pockets of risk remain.
- » **Economic policy uncertainty remains and geopolitical risk is elevated, but global financial risks are still moderate.** Restored US sanctions on Iran and heightened trade tensions led to uncertainty in the first half of 2018. Systemic financial risks have increased, reflecting reduced liquidity in the US. The continued easing in credit standards suggests investor risk appetite remains strong, but credit spreads are likely to widen significantly if risks crystallize.
- » **Weak creditworthiness indicates higher defaults for non-financial corporates in the next downturn.** Our latest corporate rating distributions indicate that the proportion of high-yield issuers is around 66% in the US, 57% in EMEA and 33% in Asia Pacific, up from 60%, 38% and 19%, respectively, in 2008. Credit spreads are likely to widen significantly in severe market stress. During a severe credit downturn, around one-quarter of currently rated corporate issuers in the US could default within three years. In addition, weaker covenants could imply higher loss given default.
- » **Funding risk could be a key issue for vulnerable banking systems, such as Turkey, Ukraine, Russia and South Africa.** If investors are concerned about threats to the economy's external vulnerability and weaknesses, they may withdraw bank funding. The Turkish banking system is the most exposed to funding shocks.
- » **Tightened financial conditions could further strain vulnerable emerging-market currencies and bonds.** While some frontier market sovereigns are among the most vulnerable countries, Argentina and Turkey show the highest risk among emerging markets. To a lesser extent, Hungary, South Africa, Chile and Poland also have external vulnerability with either lower foreign currency reserves or elevated government debt, or both.

## Market volatility returns as global trade tensions rise

Despite the solid economic backdrop, market volatility increased notably at the beginning of 2018 before generally easing since March. Recent trade tensions have generated some volatility in the equity market, notably in Asia. Our measures of asset prices declined moderately in the first half of 2018 (Exhibit 1). Government bond prices declined from high levels amid market expectations of higher interest rates in the US and other economies; meanwhile, global housing prices relative to GDP are close to 10-year averages.

In February, expectations of higher inflation pushed US Treasury yields higher, which in turn triggered a US equity correction. The sell-off contributed to the decline of exchange-traded products on the VIX index, which move in the opposite direction to the VIX, exacerbating a further surge in equity volatility. The market subsequently stabilised in March.

Exhibit 1

### Global performance of asset prices

For details, see Exhibit 33 in the appendix.

Exhibit 2

### Gap between US Treasury yields and S&P 500 earnings yields remains but is narrowing

Source: Haver Analytics

Relatively low interest rates continue to support US equities, as discussed in the previous Financial Monitor. While the gap between benchmark bond yields and the S&P 500 earnings yield has narrowed (Exhibit 2), it remains higher than over the longer term, implying that the equity risk premium may actually be higher than average.<sup>1</sup>

However, renewed concerns about disruptions to global trade have hit equities recently. Declines in US and other equity indices have accompanied the threat and subsequent imposition of US tariffs on a range of countries and exports – and the proportionate and reactive tariffs on US goods from China, the EU and others. In fact, the repeated trade announcements appear to be having a growing impact on the equity market over time, perhaps linked to their increased frequency and severity (Exhibit 3).

This publication does not announce a credit rating action. For any credit ratings referenced in this publication, please see the ratings tab on the issuer/entity page on [www.moody's.com](http://www.moody's.com) for the most updated credit rating action information and rating history.

Daily returns %

Average and standard deviation of daily returns are estimated for the period between 1 January 2016 and 26 June 2018.

\*19 June daily return is presented as Chinese stock market was closed on 16-18 June for the weekend and a holiday.

Sources: Haver Analytics, Moody's Investors Service

The market reaction suggests that a full-blown trade war could trigger a more substantial downside correction in US equities. These tensions could also spill over to other markets, as illustrated by rising "tail dependence" in global equity markets. We measure tail dependence as the probability of poor (tail) performance in one equity market given the same poor performance in another market. For instance, on days since the 2007-08 financial crisis when the daily return of the US S&P 500 Index has been below the fifth percentile, there has been a one-in-three probability that returns in other major markets will also be below the fifth percentile (Exhibit 4). This probability has nearly doubled since the 1990s.

Increases in tail dependence across equity markets could exacerbate the impact of the next financial downturn. However, overall the level of global financial integration appears similar to pre-crisis levels, according to the International Monetary Fund (Exhibit 5).

Exhibit 4

**Tail dependence on US equity has risen over the past several decades**

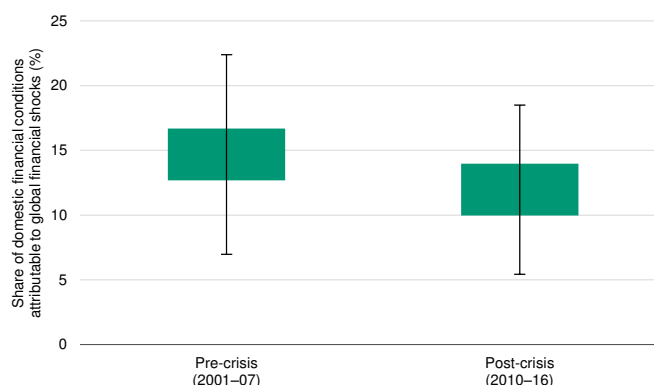

Tail dependence for the lowest 5th percentile

We define tail dependence as the probability that when the daily return of the US market is in the tail, the returns of other markets will also be in the tail.

The recent rally in US government bond yields reflects the solid economic recovery and rising US inflation expectations. For now, those higher inflation expectations look consistent with the Federal Reserve's target. In contrast, government yields in the euro area core countries remain compressed as the economic cycle (and monetary policy) lags that in the US. In May, yields of euro area peripheral

country debt, led by Italian government bonds, widened against Bunds following political turmoil in Italy, but yields have declined somewhat as uncertainty has receded (Exhibit 6). Against a backdrop of a stronger US economic environment, rising US interest rates and growing trade tensions, the currencies of a number of emerging market (EM) countries have depreciated by more than 5% since the end of 2017 (Exhibit 7). The Argentine peso and the Turkish lira weakened the most as a result of higher refinancing requirements, elevated near-term inflation prospects and willingness to use fiscal policy options constrained by higher government debt and fiscal deficits.

Exhibit 6

Exhibit 7  
**EM currencies have depreciated against the US dollar since the end of 2017**

Note: Data as of 12 July 2018.

Source: Haver Analytics

Property prices dipped in most countries during H1 2018. Price levels are generally below 10-year averages (relative to nominal GDP) in most countries. However, house prices remain elevated in a few markets. While we have seen signs of house market stabilisation in Norway, Sweden, New Zealand and Australia, elevated house prices are also reflected in either a high ratio of prices to income or high household debt to income levels (see Exhibit 33 in the Appendix for details).

### Household mortgage debt will keep rising several years after house prices peak

In a previous publication on overheating in housing markets, we noted that several countries, including Norway, Belgium and Germany, show signs of stretched house prices.<sup>2</sup> However, developments in other countries, including Canada and Sweden, where house price inflation has exceeded 40% in recent years, have indicated that a deceleration in inflation and a stabilisation of prices need not necessarily trigger a marked outright downturn (Exhibit 8).

A natural question is how household mortgage debt will react to house price stabilisation. Following a jump in house prices, it is likely that mortgage debt will keep rising for several years even after prices peak or stabilise. This dynamic reflects the normal cycle of housing turnover in which typically only a small share of the market is bought and sold each year. Because of this cycle, we should not expect house prices and mortgage debt to peak at the same time.

To illustrate this dynamic, Exhibit 9 shows results from a simple model of house prices and mortgages.<sup>3</sup> We assume 10% of households move house each year, calibrated to UK data over the past three decades. At that turnover rate, a one-off jump in house prices would be associated with rising average debt burdens for an extended period as outstanding debt incrementally absorbs the price jump.<sup>4</sup> Therefore, the credit risks associated with increased household leverage may continue to build, even as house prices stabilise and inflation abates.

Exhibit 8

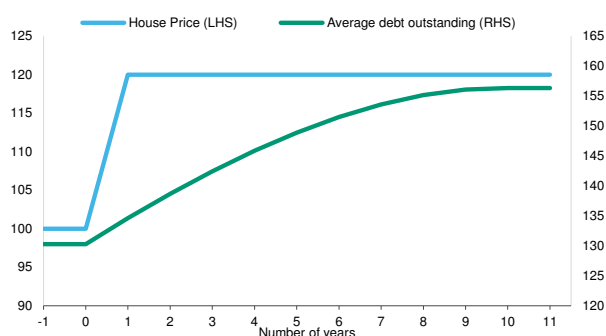

#### Real house price inflation remains elevated in Canada and Sweden 2010=100

Source: Organisation for Economic Co-operation and Development

Exhibit 9

#### Household mortgage debt keeps rising for several years after house price peaks

The horizontal axis displays the number of years before and after a jump in house prices. We constructed a simple mortgage repayment model with the following assumptions: LTV = 90% (10% cash down payment), Length of mortgage = 25 years, Interest rate (flat over mortgage) = 5%, Share of households turning over housing in each year = 10%. We modeled house prices to start at 100 for simplicity and undergo a 20% jump in period 1 and remain flat at that level thereafter.

## Economic policy uncertainty remains and geopolitical risk is elevated, but level of financial systemic risk is still moderate

In H1 2018, uncertainty around economic policy and geopolitical risk remained elevated following the restoration of US sanctions on Iran, the imposition of new US (and reciprocal) tariffs amid heightened fears of a trade war and other geopolitical risks (Exhibit 10). But the impact on market conditions was not dramatic. Our assessment is that systemic financial risks increased somewhat in H1, as reflected in reduced liquidity in US equities based on the Amihud measurement, but that the overall risk level remains moderate (Exhibit 11).<sup>5</sup> While US credit spreads remained broadly unchanged, average high-yield credit spreads in the euro area rose 90 basis points from their all-time low. However, euro area spreads remain below their long-term averages.

Exhibit 10

**Geopolitical risk and economic policy uncertainty remain elevated**

For both indices, long term averages equal 100.

Exhibit 11

**Systemic risks in global financial markets have picked up slightly**

	Risk assessment	Recent development
Asset price risk	MED	➡
Credit and market risk	MED	➡
Interest rate risk	MED	➡
Exchange rate risk	MED	➡
Market liquidity risk	MED	➡
Asset price contagion risk	LOW	➡

The assessment is based on our subjective assessment, informed by key indicators including asset price indices, corporate credit spreads, equity market implied volatility, yield curve term structure, interest rate swaps, market-implied exchange rate volatility, bid-ask spreads and market liquidity measurement, etc. For details, see [Financial conditions remain favourable as growth and banking sectors stabilise](#).

Source: Moody's Investors Service

**Investor risk appetite remains strong**

Despite reduced monetary policy accommodation, investor risk appetite remains strong. Allocation to riskier borrowers by banks and market investors remains high as illustrated by lower credit standards by banks<sup>6</sup> and weak debt covenant quality.

Bank lending standards and debt covenant quality have been weakening consistently in the US since 2011. The US Covenant Quality Indicator (CQI) has improved slightly over the last year but remains within the weakest band (Exhibit 12).<sup>7</sup> In the euro area, while risk appetite in the bond market may have picked up earlier, bank lending standards only started to loosen following the euro area sovereign crisis in 2013 (Exhibit 13). The easing trend in the euro area did not follow monetary policy easing instantaneously because of balance sheet constraints in euro area banks.

Exhibit 12

**Bank credit standards and bond covenants have been weakening in the US**

Bank credit standards are indexed and normalised to create a time series of relative tightening/weakening from the start of the survey. Covenant Quality Indicator (CQI) includes all high-yield bonds, including high-yield lite. A higher score denotes weaker covenant quality on a scale from 1.0 to 5.0. For details, see [North American Covenant Quality Indicator: Protection stabilizes, even as private equity scores continue to deteriorate](#).

Sources: Federal Reserve, Moody's Investors Service

Exhibit 13

**Euro area bank credit standards remain at ease while bond covenants reverse earlier gains**

Bank credit standards are indexed and normalised to create a time series of relative tightening/weakening from the start of the survey. The quarterly CQI score is the average covenant quality score for European high-yield that we publish a covenant quality score for and were priced in that quarter. A higher score denotes weaker covenant quality on a scale from 1.0 to 5.0. For details, see [Covenants - Europe: E-CQI erosion continued through 2017, reversing earlier gains](#).

Sources: European Central Bank, Moody's Investors Service

However, strong risk appetite may not persist, for instance as trade tensions intensify, or monetary tightening becomes more entrenched as lower unemployment in the advanced economies translates into a stronger pickup in wage growth. Whatever the trigger,

a change in the risk appetite of international investors can transmit rapidly across global financial markets as seen during previous crises. At the same time, past reductions in lending standards and covenant quality could result in higher losses for creditors when risks crystallize.

## Crystallization of risks will be painful

### Gauging when the cycle turns is difficult

Gauging when a cycle turns is extremely difficult. When the bottom of any economic cycle approaches, the signals can be mixed, with some data pointing to a positive trend, while other indicators continues to fall.

One signal that investors often reference is an inverted yield curve; a narrowing spread between long- and short-term rates may discourage long-term lending to borrowers and slow financing flows to the real economy. At the moment, the term spread (measured as the gap between 10-year and one-year US Treasury yields) is around 50 bps, the narrowest in more than a decade. And while narrowing term spreads are consistent with recent US monetary tightening and longer-term demographic and productivity trends, the prolonged period of growth has raised concerns about the timing of the next downturn.

Since the early 1950s, negative term spreads have generally preceded past downturns (Exhibit 14). Nevertheless, negative spreads – while typically occurring after a prolonged period of economic expansion – do not provide much guide as to when the economy will enter a recession. Although in some cases the US economy has started to contract within 12 months following term spreads turning negative for the first time, at other times the US economy has continued expanding for many more months or even years (Exhibit 15). Therefore, the current low term spread provides little signal as to when the ongoing expansion might end.

Exhibit 14

**Narrowing term spreads do not always signal a recession ...**

**Months until recession started when term spreads first turned negative**

Recession quarters as identified by the National Bureau of Economic Research.  
Sources: Haver Analytics, Moody's Investors Service

## Weak creditworthiness indicates higher defaults for non-financial corporates in the next downturn

Credit spreads are likely to widen significantly during a credit downturn. In times of uncertainty, investors favour safe-haven assets such as Treasury bonds over corporate bonds and they demand a higher risk premium to hold risky assets, which drives up credit spreads. However, changes in effective interest costs of corporates, measured as interest expenses over debt, tend to lag market yields significantly. Between 2007 and 2016, the decline in the average US effective interest rate was around 1.5 percentage points, half of the decline in 10-year Treasury bond yields (Exhibit 16), and the pattern was similar in the euro area (Exhibit 17). Therefore, wider spreads will not immediately affect all corporate borrowers.

Exhibit 16

### Corporate effective interest rate is smoother than Treasury yields in the US

The forecasts were calculated using the historic relationship between US corporate interest expense/debt and the US 10-year Treasury note yield, and the US 10-year Treasury yield forecasts from the Moody's Macroboard.

Sources: Haver Analytics, Moody's Investors Service

Exhibit 17

### Corporate effective interest rate is also smoother than government bond yields in the euro area

The forecasts were calculated using the historic relationship between euro area corporate interest expense/debt and German 10-year Treasury note yield, and German 10-year Treasury yield forecasts from the Moody's Macroboard.

Sources: Haver Analytics, Moody's Investors Service

Since the financial crisis, credit spreads have remained generally contained. While there have been periods with industry-specific stresses, such as in the oil industry, or region-specific stresses, such as the euro area sovereign crisis, non-financial corporates have not been subject to a pervasive and severe global stress. But the current level of spreads will not persist indefinitely. Based on past turns in the cycle, in a stressed scenario spreads could widen to similar levels as in 2009 over a relatively short period. Wider spreads would put market pressure on lower-rated issuers and raise funding costs for those that need to refinance (Exhibits 18-19). If spreads were to widen to around the same level as in 2008, corporate bond yields could reach 25% for high-yield and 9% for investment-grade corporate bonds from the current levels of around 6% and 3%, respectively. While such increases could be relatively short-lived, based on past patterns, they would have a dramatic impact on the secondary market value of investors' current holdings.

Exhibit 18

### US corporate bond spreads can widen considerably during a downturn

Exhibit 19

### European corporate bond spreads can widen considerably during a downturn

Dotted lines indicate the levels of spreads assuming they are to widen to around the same level as in 2008.

Sources: Haver Analytics, iBoxx, Moody's Investors Service

The next downturn will also be different because rated corporates represent higher credit risks, on average, than before the past downturn: the composition of rated entities has shifted over time. In particular, the extended period of benign credit conditions has provided speculative-grade companies ample opportunity to obtain financing through the capital markets, and these companies now

account for a larger share of the rated universe. Our latest corporate rating distributions indicate that the proportion of high-yield issuers is around 66% in the US, 57% in EMEA and 33% in Asia Pacific (Exhibit 20).

Exhibit 20

### Non-investment grade issuers account for around two-thirds of rated corporates in the US and EMEA

Note: Senior unsecured (or equivalent) ratings for issuers are presented.

Source: Moody's Investors Service

Lower-rated entities tend to account for less overall debt than higher-rated issuers, and therefore near-term refinancing burdens are less skewed to the lower end of the rating distribution. But even so, the share of investment-grade debt has shifted moderately to the Baa category in EMEA.<sup>8</sup> Moreover, one-third of debt maturing by 2021 is non-investment grade in the US (Exhibit 21), followed by 20% in EMEA (Exhibit 22). Maturing US high-yield debt also has a greater concentration in the lower Ba or B categories. These refinancing risks seem less widespread in Asia Pacific, with less than 10% of maturing debt below investment grade (Exhibit 23).

Exhibit 21

### US high-yield maturing debt mostly rated in lower Ba- or B-ranges

Source: Dealogic Analytics

Exhibit 22

### EMEA high-yield maturing debt mostly rated in the higher Ba-ranges

Source: Dealogic Analytics

Exhibit 23

### Asia Pacific high-yield maturing debt mostly rated in the higher Ba-ranges

Source: Dealogic Analytics

While the annual default rate for speculative-grade issuers remains low, our current ratings distribution implies a higher number of defaults if bond market liquidity dries up. This is evident in our current default forecasts: in the pessimistic scenario, the speculative-grade default rate jumps 9 percentage points to 12% (Exhibit 24). In addition, a more severe downturn could result in even more pronounced credit distress. Based on empirical three-year cumulative default rates seen from 2008, around one-quarter of currently rated corporate issuers in the US could default over three years in a similar downturn.<sup>9</sup> In addition, weaker covenants could imply higher loss given defaults, which would lead to higher losses.

Exhibit 24

**Global speculative-grade default rates could surge to 12% in the pessimistic scenario**For more details, see [Cross Sector: June 2018 Default Report](#).

Source: Moody's Investors Service

**Funding risk could be a key issue for vulnerable banking systems**

On the banking side, funding could be a key risk in some markets if investor confidence erodes and funding dries up. The Turkish banking system is the most exposed to funding shocks; Turkish banks continue to rely heavily on capital markets to finance a substantial part of their lending, with the proportion of short-term and interbank lending in market funds continuing to increase. The banking systems of Ukraine, Russia and South Africa also have elevated funding vulnerability, with lending from financial institutions and short-term borrowing accounting for half of the banks' market funding (Exhibit 25).

Exhibit 25

**Bank funding vulnerability remains elevated in Turkey, Ukraine, Russia and South Africa**

(Lending by financial institutions + short-term borrowings) / Market funds

Source: Moody's Investors Service

Moreover, market funding has become more "binary" in times of stress – likely to be either "on" or "off," rather than simply charging a higher rate to provide funding.<sup>10</sup> This binary behaviour can exacerbate funding risk. In the case of Turkey, if banks saw a similar funding stress to that seen during the Asian crisis in 1997, the net income ratio and capital ratio of the Turkish banking system could fall by 2.4 and 3.9 percentage points, respectively.<sup>11</sup>

In addition, some banking systems still face legacy issues from the financial crisis. Nonperforming loan (NPL) ratios remain elevated in a number of euro area banking systems such as Greece, Cyprus and Italy, and the limited ability of these systems to deal with distressed debt has led to lower NPL resolution. Structural reforms to address these impediments, such as reforms to regulatory and judicial systems, remain slow and halting.

## CDO issuance has declined, while commercial real estate-backed securities would be at risk if interest rates rise faster than expected

In the 2007-08 financial crisis, structured finance securities sustained significant losses. Issuance of structured finance products declined and subsequently stabilised in the aftermath of the crisis. Issuance of collateralised debt obligations (CDOs), which are among the most complex structured finance products, has declined, while the issuance of collateralised loan obligations (CLOs) has picked up in recent years because of a strong supply of collateral-leveraged loans and rising demand as investors hunt for yields (Exhibit 26). Nevertheless, the drop in the weighted average recovery rate (WARR), which partially reflects the general credit weakening in leveraged loans, highlights the risk of lower recoveries in the next credit downturn (Exhibit 27).<sup>12</sup>

Exhibit 26

### Overall issuance of structured finance products has declined since the financial crisis

Number of ratings at the start of each year

Source: Moody's Investors Service

Exhibit 27

### Reported WARR has declined for European and US CLOs

Source: Moody's Investors Service

Another area of concern is commercial mortgage-backed securities, given high commercial real estate valuations in some markets. Property yields have compressed significantly over the past few years because of the low interest rate environment (Exhibit 28). While low benchmark yields support these valuations to some extent, these valuations would be vulnerable in the event of faster-than-expected increases in interest rates and rental yields (Exhibit 29).<sup>13</sup> However, the volatile empirical relationship between government bond yields and property yields indicates that an increase in bond yields would not necessarily lead to an equivalent increase in property yields.

Exhibit 28

### Prime property yields for Western European office markets declined along with benchmark bond yields

Sources: Cushman & Wakefield Research, Haver Analytics

Exhibit 29

### Possible impact of rising property yields on commercial real estate valuations

#### Illustration for Europe

Assumptions: Rental costs and income rise in line with inflation target over a three-year period. Net rental yields are assumed to start at 4.5%, broadly in line with the current level of European prime commercial real estate. The subsequent assumed rise in yields indicated on the X-axis corresponds to the estimated decline in valuations.

Source: Moody's Investors Service

## Tightened financial conditions could further strain vulnerable EM currencies and bonds

One factor currently underpinning the relative calm in financial markets is the continued provision of unprecedented levels of liquidity to the global financial system by major central banks. This liquidity has helped lower the cost of borrowing globally, for corporates and sovereigns. Therefore, it is likely that any tightening in financial conditions could strain vulnerable EM currencies and bonds. The most vulnerable sovereigns are generally those with low debt affordability, shorter maturities and high debt levels. Based on scenario analysis, Latin America and the Caribbean and sub-Saharan Africa are most exposed via weaker debt affordability.<sup>14</sup>

Pressure on currencies arising from US monetary tightening will also exacerbate the strain on countries with high external vulnerabilities. Frontier market sovereigns are often most vulnerable to a shift in external financial conditions thanks to their high reliance on external financing; examples include Ghana and Mongolia.<sup>15</sup> But larger EMs are also vulnerable; and based on a range of common indicators including our External Vulnerability Indicator,<sup>16</sup> some major EMs — in particular Argentina and Turkey — look more exposed than others (Exhibit 30). To a lesser extent, Hungary, South Africa, Chile and Poland also exhibit external vulnerability with either lower foreign-currency reserves or elevated government debt, or both.

Exhibit 30

**Argentina and Turkey are among the most vulnerable EM countries**

	Rating	Current account % GDP (2018F)	Foreign currency reserve / month import (2018)	External vulnerability indicator (2018F)	Govt FC debt/total govt debt (2018F)	Gen. Gov. debt/GDP (2018F)	Gen. Gov. IP/Gen. Gov. revenue (2018F)	Weighted average term to maturity

Shading indicates the outlook of the system (and expected trend of each driver): green, positive (improving); light orange, stable (stable); dark orange, negative (deteriorating). Systems marked with (\*) do not have a formal outlook and projections are based on a top/down, macroeconomic driven model. We use the latest available data for 2017. Projections for credit costs are also based on a macrodriven model. Gaps for latest data reflect missing data. All data points correspond to Moody's rated banks. For some systems, asset risk and capital is assessed as a single driver.

1-1.3 standard deviations above 10-year average

1.3-2 standard deviations above 10-year average

&gt;2 standard deviations above 10-year average

NA

Shading colours are based on the number of standard deviations away from 10-year averages: darker shading indicates more elevated asset prices or deficits. Equity and House Price indices have been divided by nominal GDP given the general upward trend in those nominal asset prices; but six-month changes in the table are based on nominal indices. House prices and private credit are based on Q1 2018 and Q4 2017 data, respectively. Current account positions are four-quarter averages. For more details of our approach to constructing asset price indices, see [Reflation expectations drive advances in equity and property markets](#).

Green (orange) shade indicates higher (lower) issuance volume from reference quarter. A darker color shading indicates a larger change. (\*) This table provides information on medium- and long-term private (excluding sovereign) debt (with initial maturities over one year) issued by rated and non-rated issuers globally sourced from Dealogic DCM. The data have not been adjusted by Moody's. Financial institutions issuance excludes covered bonds and government guarantee debt. Data were updated on 2 July 2018.

## Endnotes

- 1 Other things being equal, a lower equity risk premium increases the risk of equities being overvalued.
- 2 For details, see [Housing - Global: High house prices pose persistent risk where slow to adjust to homeownership costs](#), 14 December 2017.
- 3 We constructed a simple mortgage repayment model with the following assumptions: LTV = 90% (10% cash down payment), Length of mortgage = 25 years, Interest rate (flat over mortgage) = 5%, Share of households turning over housing in each year = 10%. We modelled house prices to start at 100 for simplicity and undergo a 20% jump in year 1 and remain flat at that level thenceforth.
- 4 For details, see [Bank of England Quarterly Bulletin, 2003](#).
- 5 Measured as absolute daily returns divided by daily volumes. Amihud, Y (2002). Illiquidity and stock returns: Cross-section and time series effects, *Journal of Financial Markets* 5, 31-56. Also see [Moody's Financial Monitor: Liquidity events are more likely to be fleeting than sustained](#), 20 July 2017.
- 6 Bank credit standards, usually presented as "Net tightening/weakening" in surveys by the ECB and Federal Reserve, are indexed and normalised to create a time series of relative tightening/weakening from the start of the survey. The Fed Senior Loan Officer Opinion Survey starts in Q1 1990, and the ECB Bank Lending Survey starts in Q1 2003.
- 7 The index starts in 2011. A higher score denotes weaker covenant quality on a scale from 1.0 to 5.0. For details, see [North American Covenant Quality Indicator: Protection stabilizes, even as private equity scores continue to deteriorate](#).
- 8 EMEA companies entering investment grade since June 2017 are now rated Baa. Baa rated companies account for 53% of total debt, up from 50% in 2017. For details, see [Four-year debt maturities rise to \\$1.4 trillion following rating upgrades](#).
- 9 We simulate the default rates over three years by applying the empirical three-year cumulative defaults rates seen for the 2008 cohort to the current rating distribution.
- 10 For details, see [Bank of England Quarterly Bulletin 2014 Q4](#).
- 11 To simulate an extremely adverse scenario, we used the 1997 Asian crisis as our benchmark and applied the change in net interest income in Thailand, the most harshly affected banking system during that crisis. Net interest income at Thai banks fell by 71.7% in 1998 and 12.7% in 1999. For details see [Macro Stress Test: Significant Recapitalization Would be Needed if a Balance of Payments Crisis Were to Materialize](#), 12 October 2016.
- 12 For details, see [CLOs - Global: Falling WARR is latest hit to trading flexibility, ability to absorb further collateral weakening](#), 23 April 2018.
- 13 For details, see [Rising interest rates credit neutral for most asset classes, credit negative for CMBS](#), 24 May 2018.
- 14 For details, see [Weakest MENA and APAC sovereigns would be most sensitive to an interest rate shock](#), 13 May 2018.
- 15 For details, see [Sovereigns - Global: US dollar appreciation raises credit risk for sovereigns with large external funding needs](#), 27 June 2018.
- 16 Our External Vulnerability Indicator is calculated as:  $EVI = (\text{short-term external debt} + \text{currently maturing long-term external debt} + \text{total nonresident deposits over one year}) / \text{Official foreign exchange reserves}$ .

CREDIT RATINGS ISSUED BY MOODY'S INVESTORS SERVICE, INC. AND ITS RATINGS AFFILIATES ("MIS") ARE MOODY'S CURRENT OPINIONS OF THE RELATIVE FUTURE CREDIT RISK OF ENTITIES, CREDIT COMMITMENTS, OR DEBT OR DEBT-LIKE SECURITIES, AND MOODY'S PUBLICATIONS MAY INCLUDE MOODY'S CURRENT OPINIONS OF THE RELATIVE FUTURE CREDIT RISK OF ENTITIES, CREDIT COMMITMENTS, OR DEBT OR DEBT-LIKE SECURITIES. MOODY'S DEFINES CREDIT RISK AS THE RISK THAT AN ENTITY MAY NOT MEET ITS CONTRACTUAL, FINANCIAL OBLIGATIONS AS THEY COME DUE AND ANY ESTIMATED FINANCIAL LOSS IN THE EVENT OF DEFAULT. CREDIT RATINGS DO NOT ADDRESS ANY OTHER RISK, INCLUDING BUT NOT LIMITED TO: LIQUIDITY RISK, MARKET VALUE RISK, OR PRICE VOLATILITY. CREDIT RATINGS AND MOODY'S OPINIONS INCLUDED IN MOODY'S PUBLICATIONS ARE NOT STATEMENTS OF CURRENT OR HISTORICAL FACT. MOODY'S PUBLICATIONS MAY ALSO INCLUDE QUANTITATIVE MODEL-BASED ESTIMATES OF CREDIT RISK AND RELATED OPINIONS OR COMMENTARY PUBLISHED BY MOODY'S ANALYTICS, INC. CREDIT RATINGS AND MOODY'S PUBLICATIONS DO NOT CONSTITUTE OR PROVIDE INVESTMENT OR FINANCIAL ADVICE, AND CREDIT RATINGS AND MOODY'S PUBLICATIONS ARE NOT AND DO NOT PROVIDE RECOMMENDATIONS TO PURCHASE, SELL, OR HOLD PARTICULAR SECURITIES. NEITHER CREDIT RATINGS NOR MOODY'S PUBLICATIONS COMMENT ON THE SUITABILITY OF AN INVESTMENT FOR ANY PARTICULAR INVESTOR. MOODY'S ISSUES ITS CREDIT RATINGS AND PUBLISHES MOODY'S PUBLICATIONS WITH THE EXPECTATION AND UNDERSTANDING THAT EACH INVESTOR WILL, WITH DUE CARE, MAKE ITS OWN STUDY AND EVALUATION OF EACH SECURITY THAT IS UNDER CONSIDERATION FOR PURCHASE, HOLDING, OR SALE.

MOODY'S CREDIT RATINGS AND MOODY'S PUBLICATIONS ARE NOT INTENDED FOR USE BY RETAIL INVESTORS AND IT WOULD BE RECKLESS AND INAPPROPRIATE FOR RETAIL INVESTORS TO USE MOODY'S CREDIT RATINGS OR MOODY'S PUBLICATIONS WHEN MAKING AN INVESTMENT DECISION. IF IN DOUBT YOU SHOULD CONTACT YOUR FINANCIAL OR OTHER PROFESSIONAL ADVISER. ALL INFORMATION CONTAINED HEREIN IS PROTECTED BY LAW, INCLUDING BUT NOT LIMITED TO, COPYRIGHT LAW, AND NONE OF SUCH INFORMATION MAY BE COPIED OR OTHERWISE REPRODUCED, REPACKAGED, FURTHER TRANSMITTED, TRANSFERRED, DISSEMINATED, REDISTRIBUTED OR RESOLD, OR STORED FOR SUBSEQUENT USE FOR ANY SUCH PURPOSE, IN WHOLE OR IN PART, IN ANY FORM OR MANNER OR BY ANY MEANS WHATSOEVER, BY ANY PERSON WITHOUT MOODY'S PRIOR WRITTEN CONSENT.

CREDIT RATINGS AND MOODY'S PUBLICATIONS ARE NOT INTENDED FOR USE BY ANY PERSON AS A BENCHMARK AS THAT TERM IS DEFINED FOR REGULATORY PURPOSES AND MUST NOT BE USED IN ANY WAY THAT COULD RESULT IN THEM BEING CONSIDERED A BENCHMARK.

All information contained herein is obtained by MOODY'S from sources believed by it to be accurate and reliable. Because of the possibility of human or mechanical error as well as other factors, however, all information contained herein is provided "AS IS" without warranty of any kind. MOODY'S adopts all necessary measures so that the information it uses in assigning a credit rating is of sufficient quality and from sources MOODY'S considers to be reliable including, when appropriate, independent third-party sources. However, MOODY'S is not an auditor and cannot in every instance independently verify or validate information received in the rating process or in preparing the Moody's publications.

To the extent permitted by law, MOODY'S and its directors, officers, employees, agents, representatives, licensors and suppliers disclaim liability to any person or entity for any indirect, special, consequential, or incidental losses or damages whatsoever arising from or in connection with the information contained herein or the use of or inability to use any such information, even if MOODY'S or any of its directors, officers, employees, agents, representatives, licensors or suppliers is advised in advance of the possibility of such losses or damages, including but not limited to: (a) any loss of present or prospective profits or (b) any loss or damage arising where the relevant financial instrument is not the subject of a particular credit rating assigned by MOODY'S.

To the extent permitted by law, MOODY'S and its directors, officers, employees, agents, representatives, licensors and suppliers disclaim liability for any direct or compensatory losses or damages caused to any person or entity, including but not limited to by any negligence (but excluding fraud, willful misconduct or any other type of liability that, for the avoidance of doubt, by law cannot be excluded) on the part of, or any contingency within or beyond the control of, MOODY'S or any of its directors, officers, employees, agents, representatives, licensors or suppliers, arising from or in connection with the information contained herein or the use of or inability to use any such information.

NO WARRANTY, EXPRESS OR IMPLIED, AS TO THE ACCURACY, TIMELINESS, COMPLETENESS, MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OF ANY SUCH RATING OR OTHER OPINION OR INFORMATION IS GIVEN OR MADE BY MOODY'S IN ANY FORM OR MANNER WHATSOEVER.

Moody's Investors Service, Inc., a wholly-owned credit rating agency subsidiary of Moody's Corporation ("MCO"), hereby discloses that most issuers of debt securities (including corporate and municipal bonds, debentures, notes and commercial paper) and preferred stock rated by Moody's Investors Service, Inc. have, prior to assignment of any rating, agreed to pay to Moody's Investors Service, Inc. for appraisal and rating services rendered by it fees ranging from \$1,500 to approximately \$2,500,000. MCO and MIS also maintain policies and procedures to address the independence of MIS's ratings and rating processes. Information regarding certain affiliations that may exist between directors of MCO and rated entities, and between entities who hold ratings from MIS and have also publicly reported to the SEC an ownership interest in MCO of more than 5%, is posted annually at [www.moody's.com](http://www.moody's.com) under the heading "Investor Relations — Corporate Governance — Director and Shareholder Affiliation Policy."

Additional terms for Australia only: Any publication into Australia of this document is pursuant to the Australian Financial Services License of MOODY'S affiliate, Moody's Investors Service Pty Limited ABN 61 003 399 657 AFSL 336969 and/or Moody's Analytics Australia Pty Ltd ABN 94 105 136 972 AFSL 383569 (as applicable). This document is intended to be provided only to "wholesale clients" within the meaning of section 761G of the Corporations Act 2001. By continuing to access this document from within Australia, you represent to MOODY'S that you are, or are accessing the document as a representative of, a "wholesale client" and that neither you nor the entity you represent will directly or indirectly disseminate this document or its contents to "retail clients" within the meaning of section 761G of the Corporations Act 2001. MOODY'S credit rating is an opinion as to the creditworthiness of a debt obligation of the issuer, not on the equity securities of the issuer or any form of security that is available to retail investors. It would be reckless and inappropriate for retail investors to use MOODY'S credit ratings or publications when making an investment decision. If in doubt you should contact your financial or other professional adviser.

Additional terms for Japan only: Moody's Japan K.K. ("MJKK") is a wholly-owned credit rating agency subsidiary of Moody's Group Japan G.K., which is wholly-owned by Moody's Overseas Holdings Inc., a wholly-owned subsidiary of MCO. Moody's SF Japan K.K. ("MSFJ") is a wholly-owned credit rating agency subsidiary of MJKK. MSFJ is not a Nationally Recognized Statistical Rating Organization ("NRSRO"). Therefore, credit ratings assigned by MSFJ are Non-NRSRO Credit Ratings. Non-NRSRO Credit Ratings are assigned by an entity that is not a NRSRO and, consequently, the rated obligation will not qualify for certain types of treatment under U.S. laws. MJKK and MSFJ are credit rating agencies registered with the Japan Financial Services Agency and their registration numbers are FSA Commissioner (Ratings) No. 2 and 3 respectively.

MJKK or MSFJ (as applicable) hereby disclose that most issuers of debt securities (including corporate and municipal bonds, debentures, notes and commercial paper) and preferred stock rated by MJKK or MSFJ (as applicable) have, prior to assignment of any rating, agreed to pay to MJKK or MSFJ (as applicable) for appraisal and rating services rendered by it fees ranging from JPY200,000 to approximately JPY350,000,000.

MJKK and MSFJ also maintain policies and procedures to address Japanese regulatory requirements.
